# a.Ejercicio 1

## a. Prólogo

Este documento contiene el código que se ejecuta en el video enlazado a continuación.

<https://drive.google.com/file/d/0BxCEkST1S7jLOWdMRldrRIZsUWs/view?usp=sharing>

El sistema de testing está formado por una base de datos POSTGRESQL, que debido al gran número de fallos y problemas que hemos tenido, probablemente no sea la plataforma a utilizar en el futuro, unas clases de dominio en el package as.entity, unos archivos de configuración de hibernate, y unas clases de interfaz para las pruebas.

Como son pruebas muy específicas de un sistema parcial, estas clases de testing se encargan de hacer consultas a la base de datos y de mostrar un menú que nos permite, crear una nueva partida, o ver/editar las casillas de una partida existente.

## b. Tablas de la base de datos

### i. Tabla casella

```
CREATE TABLE casella
(
  idpartida integer NOT NULL,
  numerofila integer NOT NULL,
  numerocolumna integer NOT NULL,
  numero integer,
  CONSTRAINT "Casella_pkey" PRIMARY KEY (idpartida, numerofila, numerocolumna),
  CONSTRAINT "Casella_idPartida_fkey" FOREIGN KEY (idpartida)
  REFERENCES partidas (idpartida) MATCH SIMPLE
  ON UPDATE NO ACTION ON DELETE NO ACTION
)
```

idpartida [PK] integer	numerofila [PK] integer	numerocolumna [PK] integer	numero integer

### ii. Tabla partidas

```
CREATE TABLE partidas
(
  idpartida integer NOT NULL,
  estaacabada boolean,
  estajugada boolean,
  puntuacion integer,
  CONSTRAINT "PK" PRIMARY KEY (idpartida)
)
```

idpartida [PK] integer	estaacabada boolean	estajugada boolean	puntuacion integer

## c. Clases Dominio

### i. Partidas

```
package as.entity;
import java.util.HashSet;
import java.util.Set;
import org.hibernate.Session;

/**
 * Partidas generated by hbm2java
 */
public class Partidas implements java.io.Serializable {
    private int idPartida;
    private Boolean estaAcabada;
    private Boolean estaJugada;
    private Integer puntuacion;
    private Set casellas = new HashSet(16);

    public Partidas() {
    }

    public Partidas(int idPartida) {
        this.idPartida = idPartida;

        this.estaAcabada = false;
        this.estaJugada = false;
        this.puntuacion = 0;
        for (int i = 0; i < 4; ++i) {
            for (int j = 0; j < 4; ++j) {
                this.casellas.add(new Casella(i, j, 0, this));
            }
        }
    }

    public Partidas(int idPartida, Boolean estaAcabada, Boolean estaJugada, Integer puntuacion,
        Set casellas) {
        this.idPartida = idPartida;
        this.estaAcabada = estaAcabada;
        this.estaJugada = estaJugada;
        this.puntuacion = puntuacion;
        this.casellas = casellas;
    }

    public int getIdPartida() {
        return this.idPartida;
    }

    public void setIdPartida(int idPartida) {
        this.idPartida = idPartida;
    }
}
```

```

public Boolean getEstaAcabada() {
return this.estaAcabada;
}

public void setEstaAcabada(Boolean estaAcabada) {
    this.estaAcabada = estaAcabada;
}
public Boolean getEstaJugada() {
return this.estaJugada;
}

public void setEstaJugada(Boolean estaJugada) {
    this.estaJugada = estaJugada;
}
public Integer getPuntuacion() {
return this.puntuacion;
}

public void setPuntuacion(Integer puntuacion) {
this.puntuacion = puntuacion;
}
public Set getCasellas() {
return this.casellas;
}

public void setCasellas(Set casellas) {
    this.casellas = casellas;
}

public void persiste(Session sesion) {
sesion.beginTransaction();
sesion.persist(this);
for (Object c : casellas) {
sesion.persist((Casella)c);
}
sesion.getTransaction().commit();

}
}

```

## ii. CasellaId

```
package as.entity;

/**
 * CasellaId generated by hbm2java
 */
public class CasellaId implements java.io.Serializable {
    private int idPartida;
    private int numeroFila;
    private int numeroColumna;

    public CasellaId() {
    }

    public CasellaId(int idPartida, int numeroFila, int numeroColumna) {
        this.idPartida = idPartida;
        this.numeroFila = numeroFila;
        this.numeroColumna = numeroColumna;
    }

    public int getIdPartida() {
        return this.idPartida;
    }

    public void setIdPartida(int idPartida) {
        this.idPartida = idPartida;
    }

    public int getNumeroFila() {
        return this.numeroFila;
    }

    public void setNumeroFila(int numeroFila) {
        this.numeroFila = numeroFila;
    }

    public int getNumeroColumna() {
        return this.numeroColumna;
    }

    public void setNumeroColumna(int numeroColumna) {
        this.numeroColumna = numeroColumna;
    }

    public boolean equals(Object other) {
        if ( (this == other) ) return true;
        if ( (other == null) ) return false;
        if ( !(other instanceof CasellaId) ) return false;
        CasellaId castOther = ( CasellaId ) other;

        return (this.getIdPartida()==castOther.getIdPartida())
        && (this.getNumeroFila()==castOther.getNumeroFila())
        && (this.getNumeroColumna()==castOther.getNumeroColumna());
    }
}
```

```
public int hashCode() {  
    int result = 17;  
  
    result = 37 * result + this.getIdPartida();  
    result = 37 * result + this.getNumeroFila();  
    result = 37 * result + this.getNumeroColumna();  
    return result;  
}  
  
}
```

### iii. Casella

```
package as.entity;

/**
 * Casella generated by hbm2java
 */
public class Casella implements java.io.Serializable {
    private CasellaId id;
    private Partidas partidas;
    private Integer numero;

    public Casella() {
    }
    public Casella(CasellaId id, Partidas partidas) {
        this.id = id;
        this.partidas = partidas;
    }
    public Casella(int fila, int columna, int punt, Partidas partidas) {
        this.id = new CasellaId(partidas.getIdPartida(),fila,columna);
        this.partidas = partidas;
        this.numero = punt;
    }
    public Casella(CasellaId id, Partidas partidas, Integer numero) {
        this.id = id;
        this.partidas = partidas;
        this.numero = numero;
    }

    public CasellaId getId() {
        return this.id;
    }

    public void setId(CasellaId id) {
        this.id = id;
    }
    public Partidas getPartidas() {
        return this.partidas;
    }

    public void setPartidas(Partidas partidas) {
        this.partidas = partidas;
    }
    public Integer getNumero() {
        return this.numero;
    }

    public void setNumero(Integer numero) {
        this.numero = numero;
    }
}
```

## d. Hibernate Configuration Files

## b. Ejercicio 2

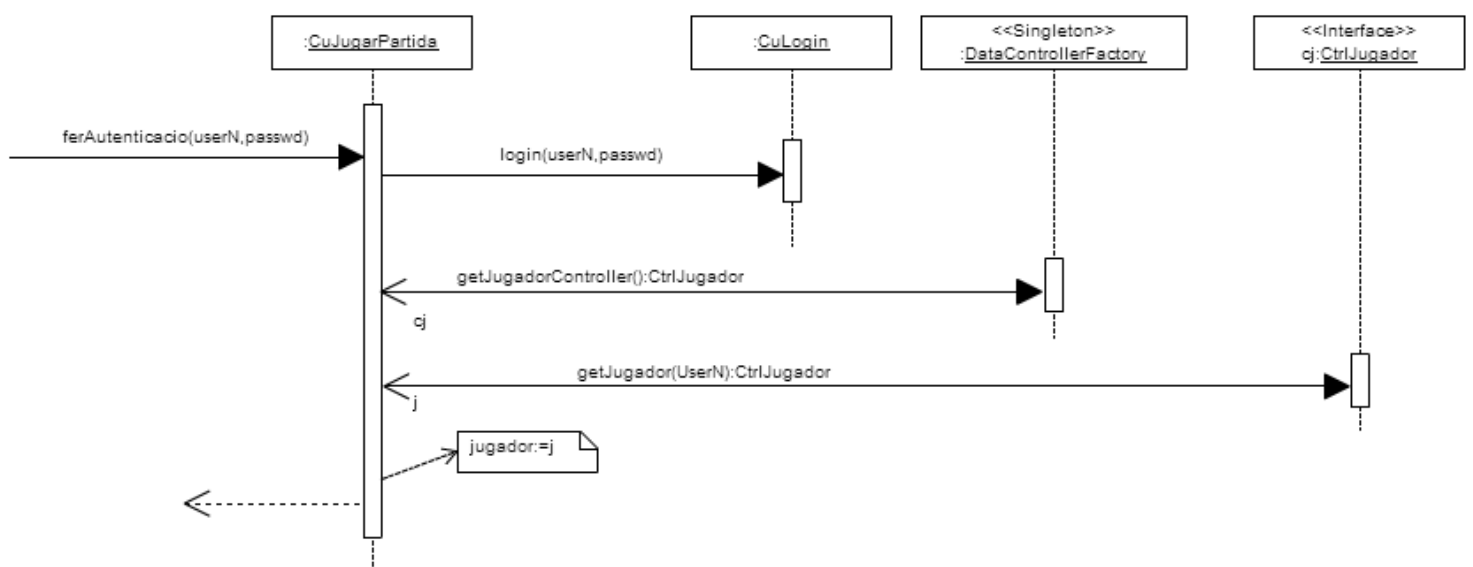

### a. Caso de uso Login

#### i. Contrato login

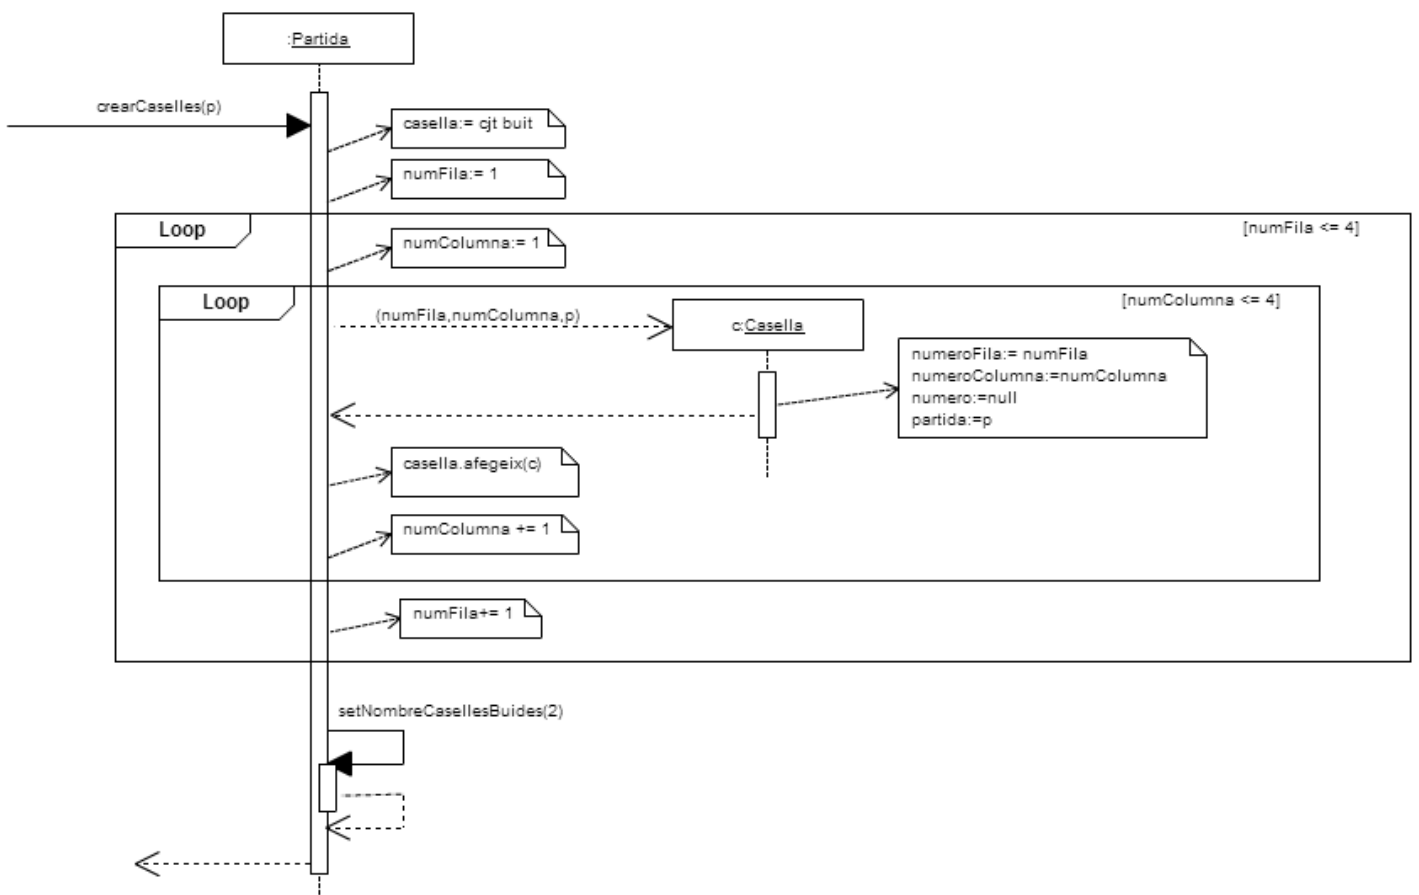

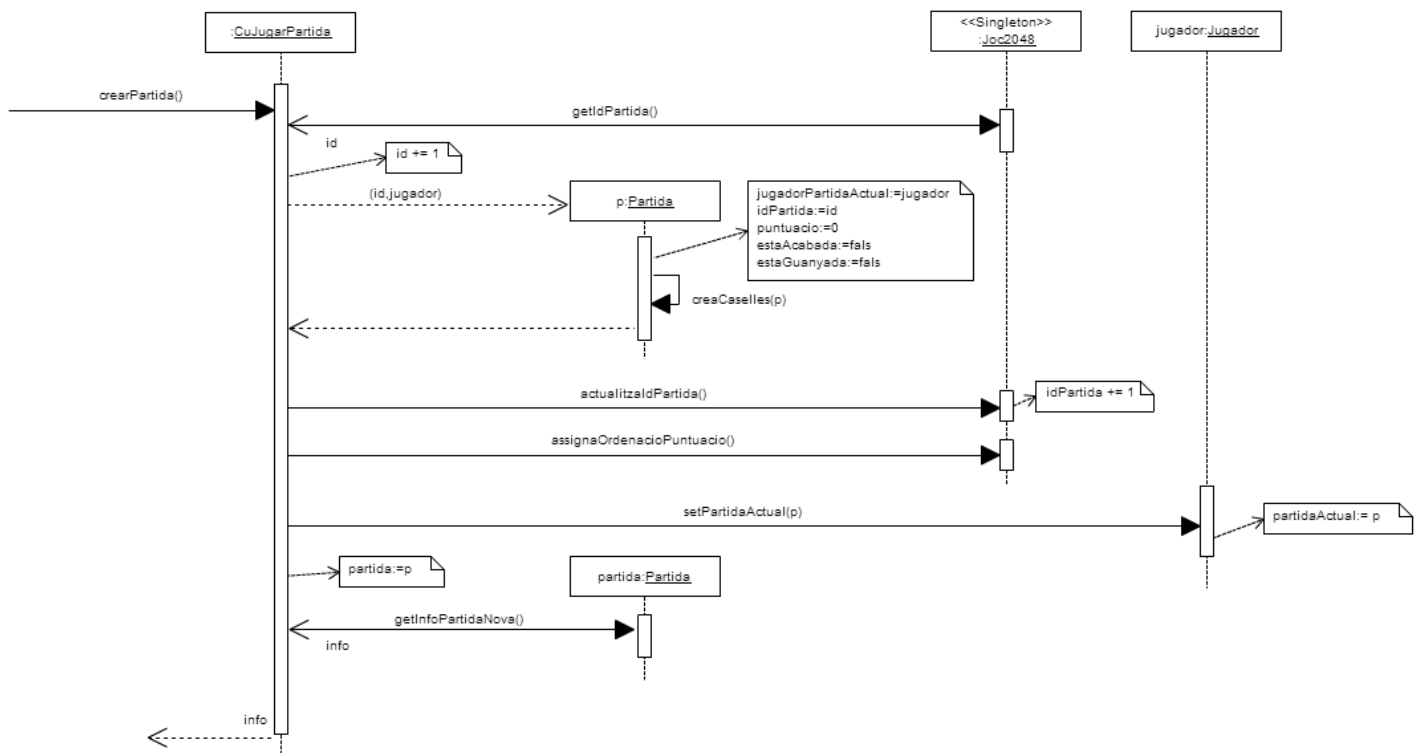

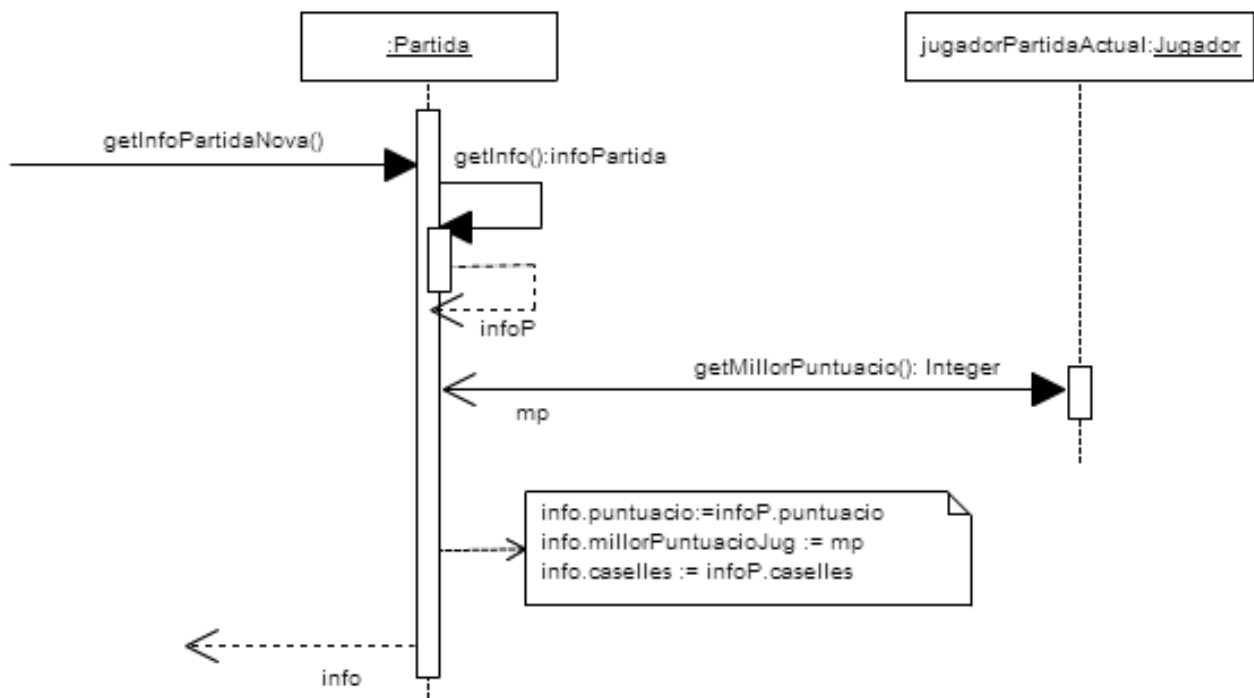

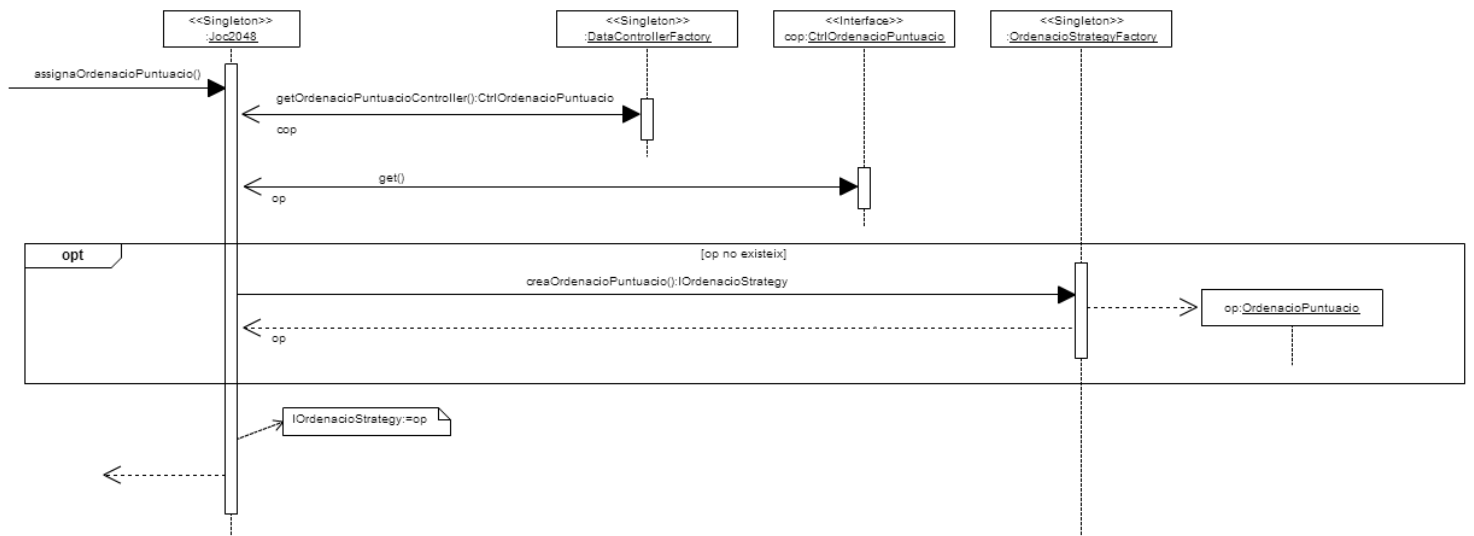

### b. Caso de uso Jugar partida

#### i. Contrato FerAutenticacio

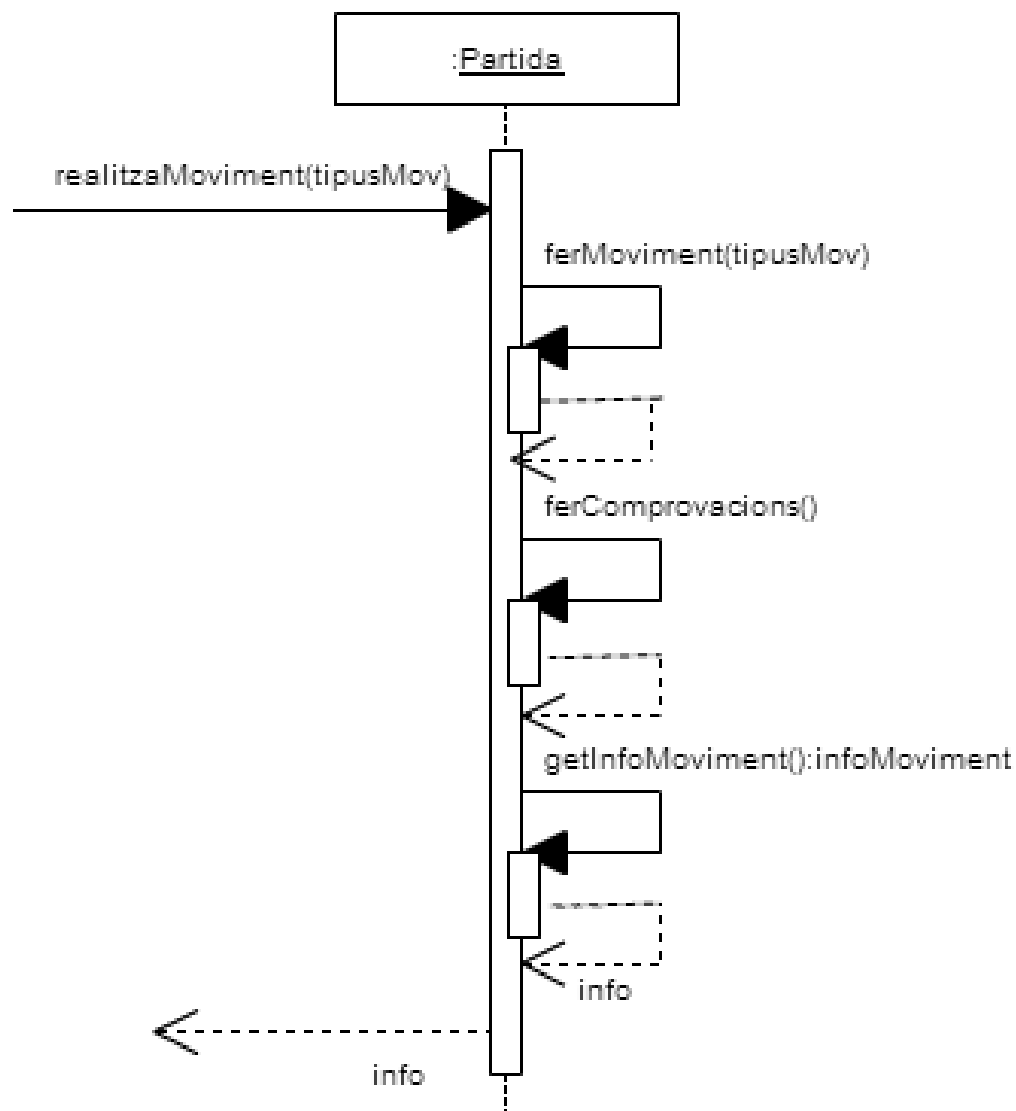

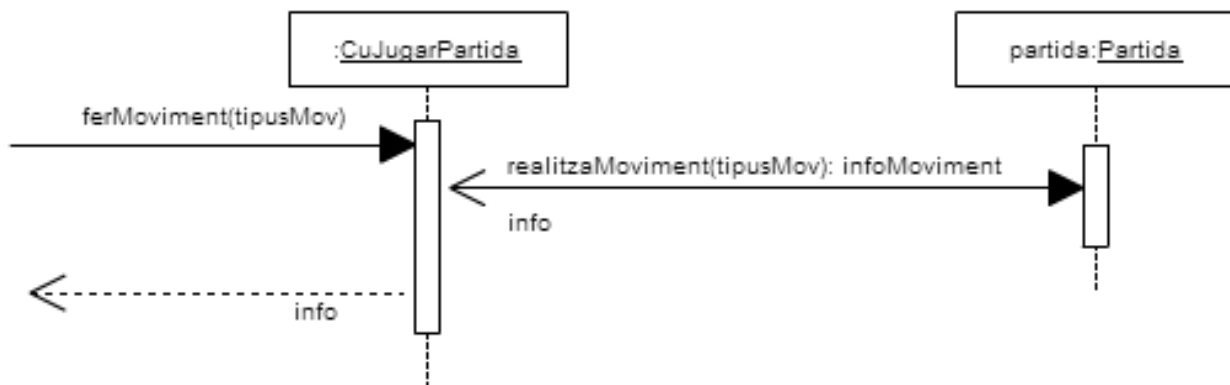

## ii. Contrato CrearPartida

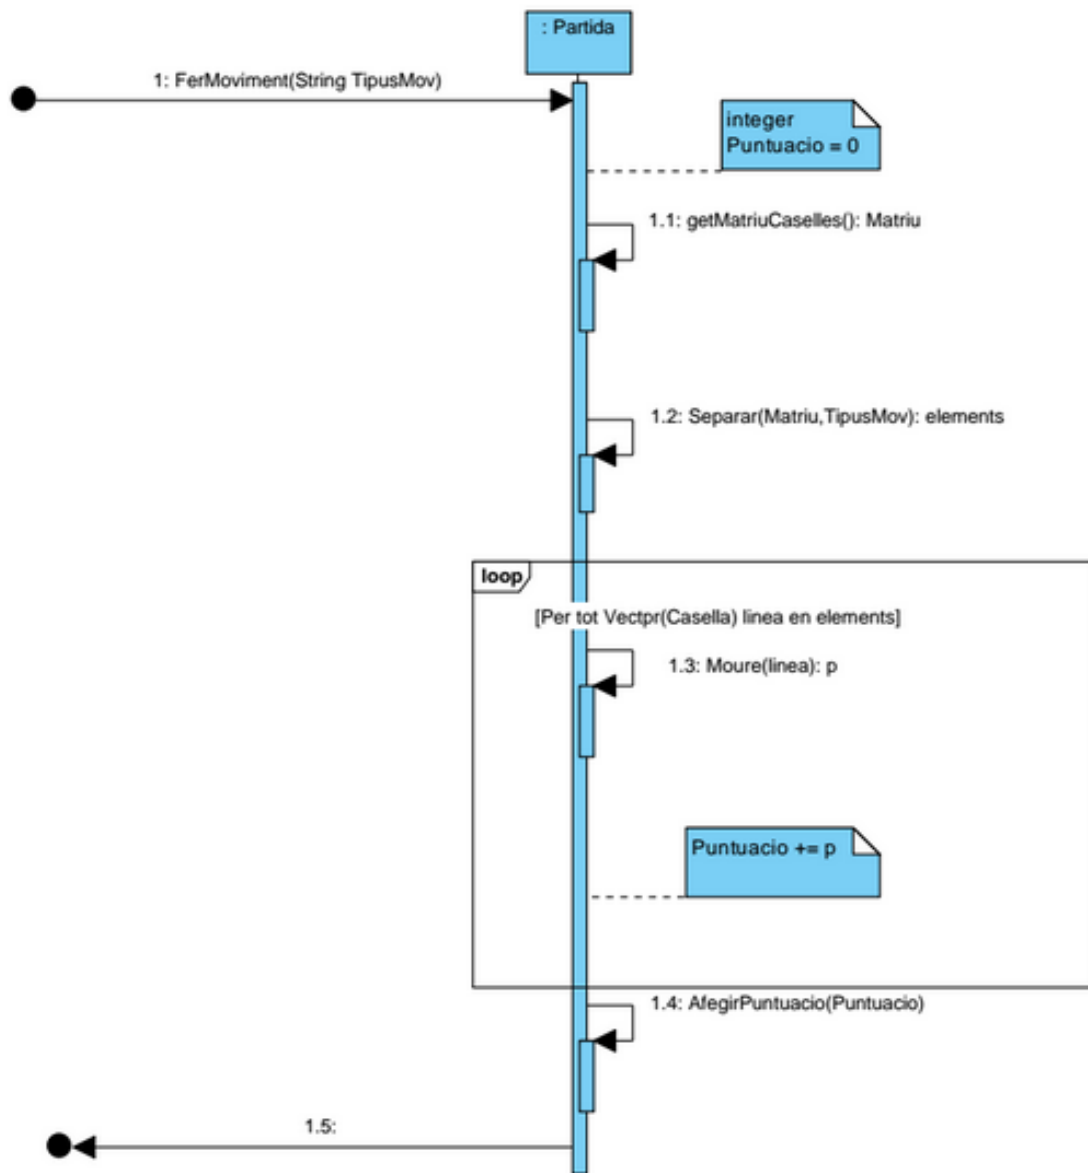

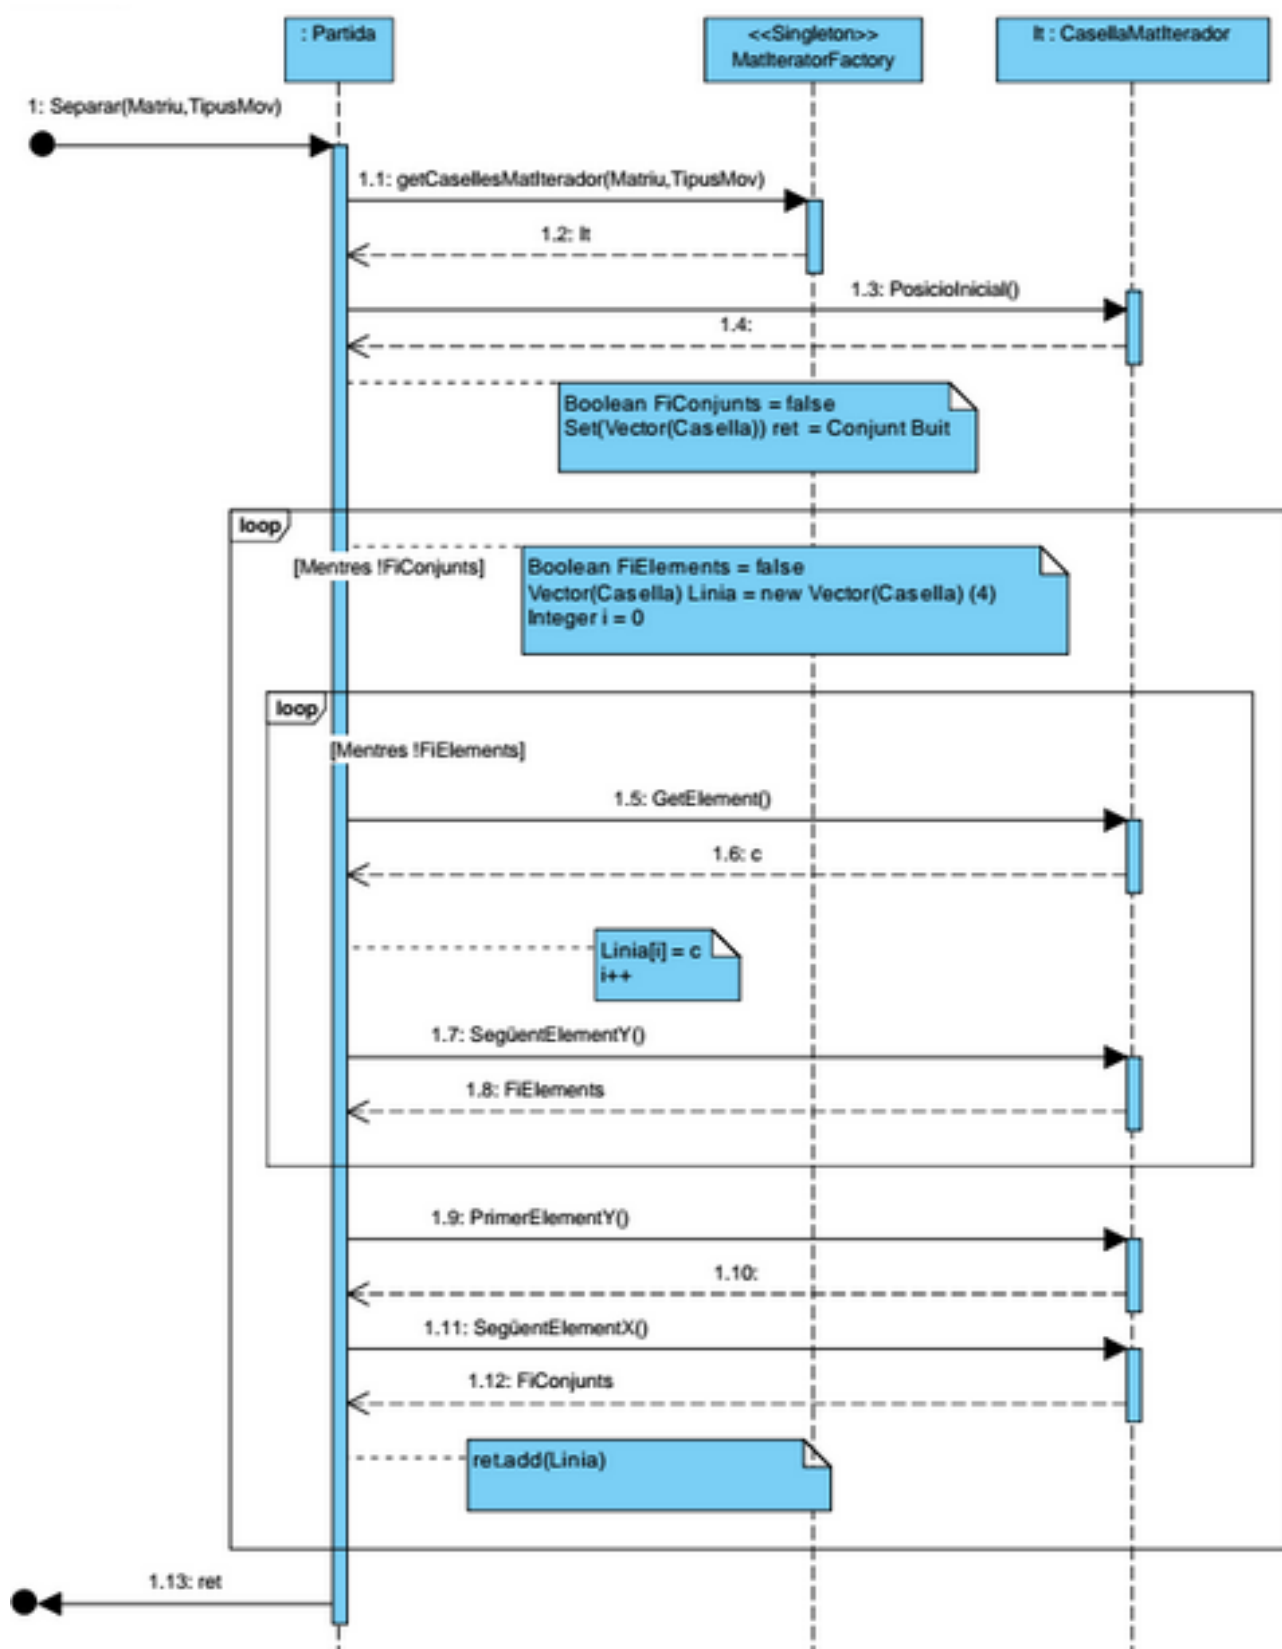

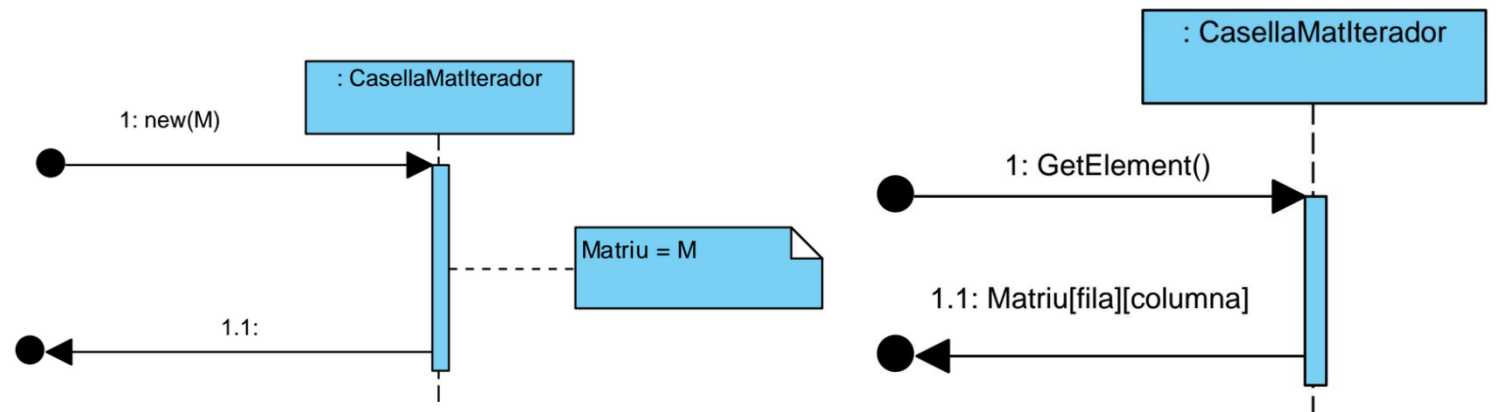

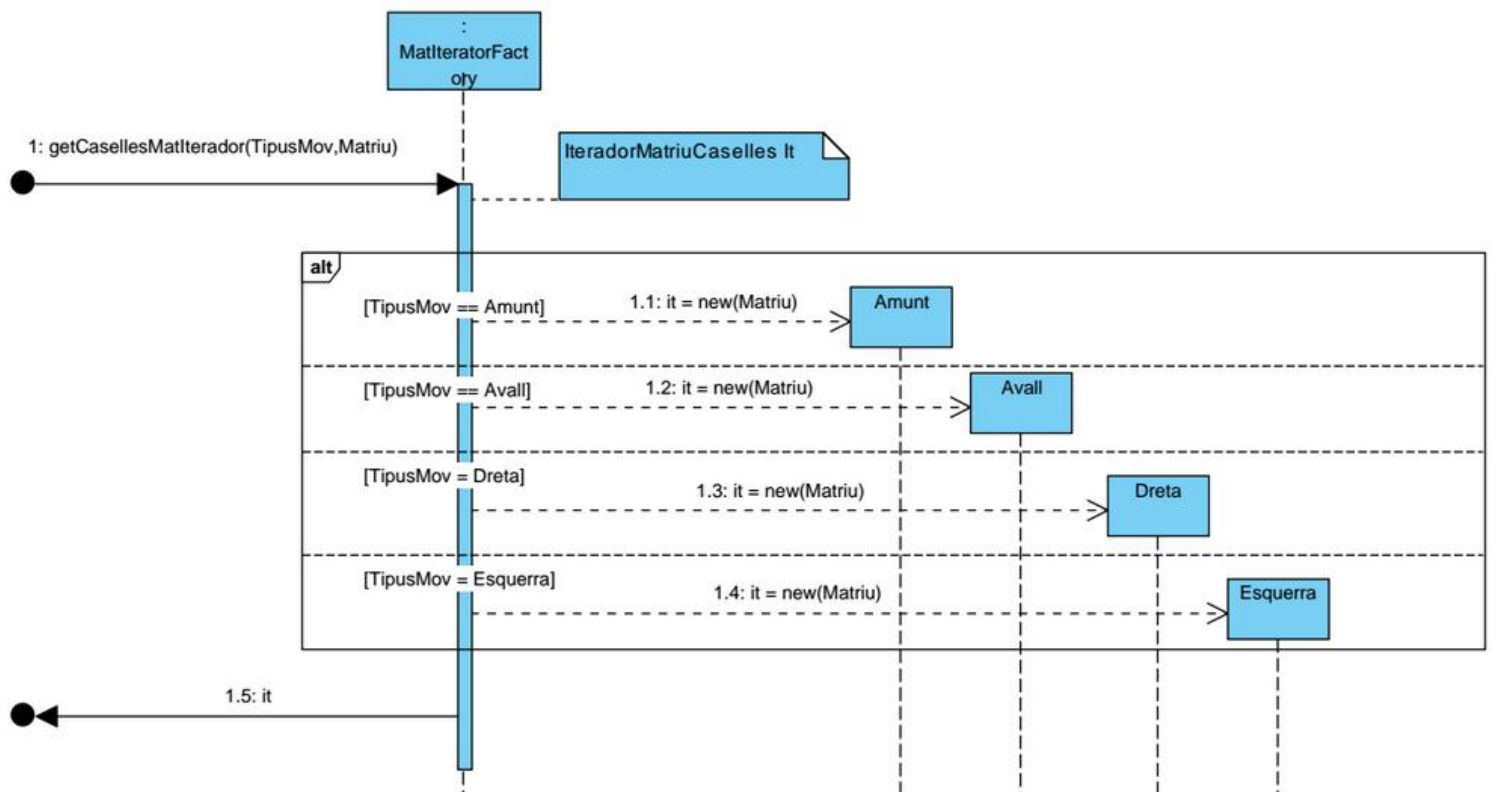

### iii. Contrato FerMoviment

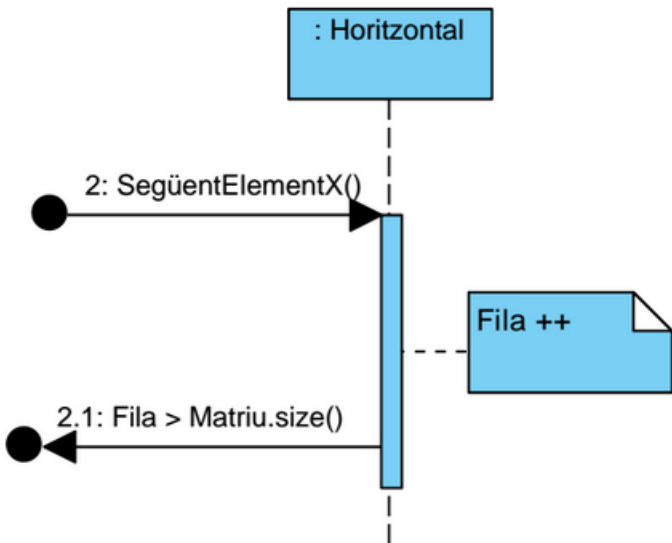

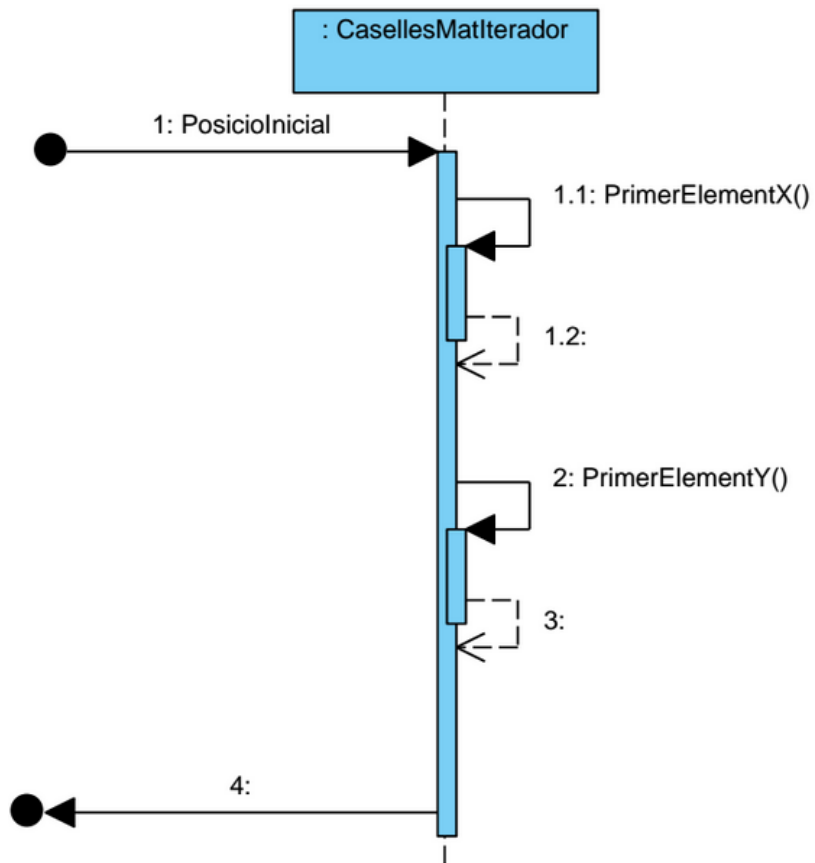

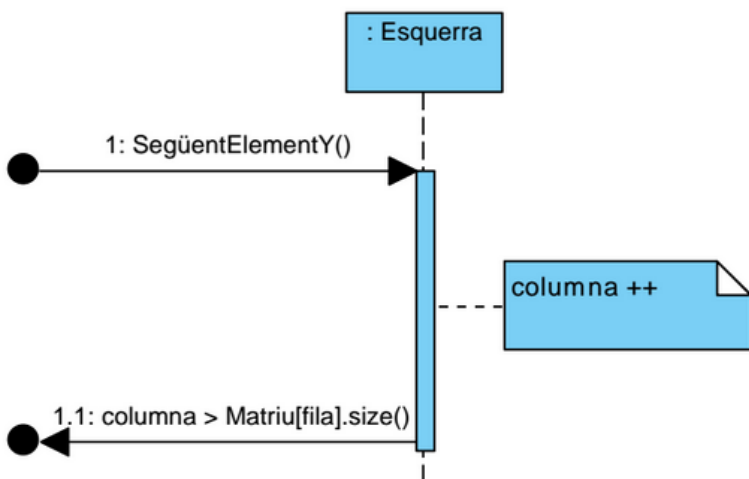

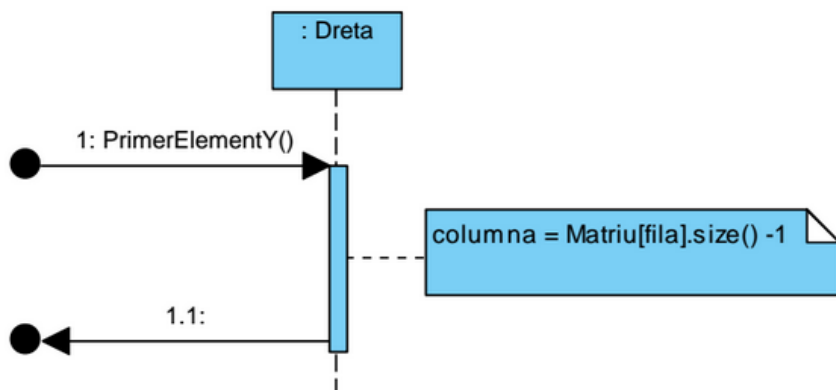

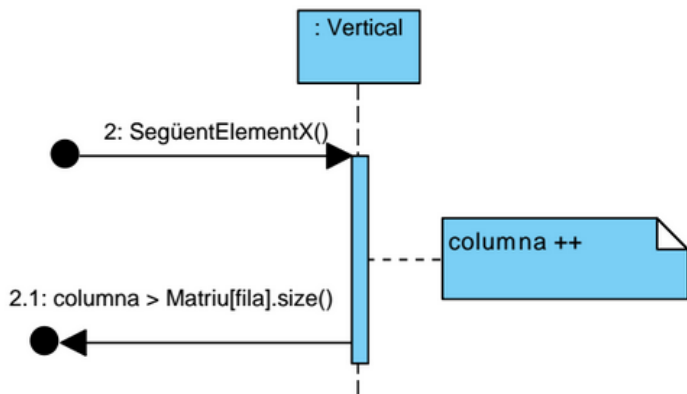

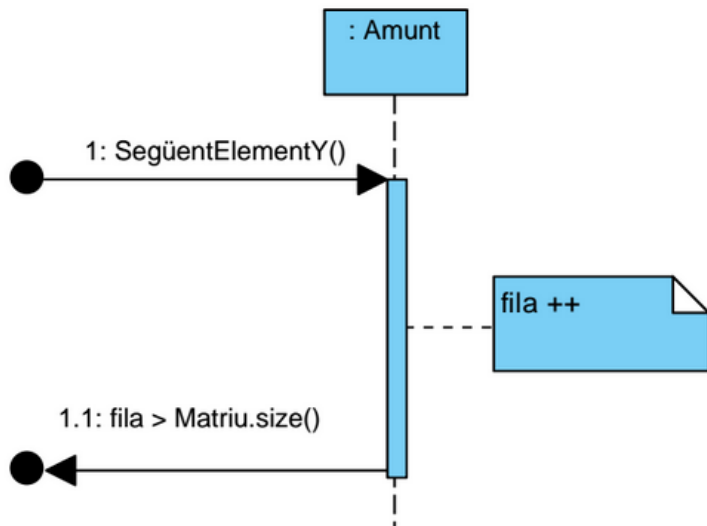

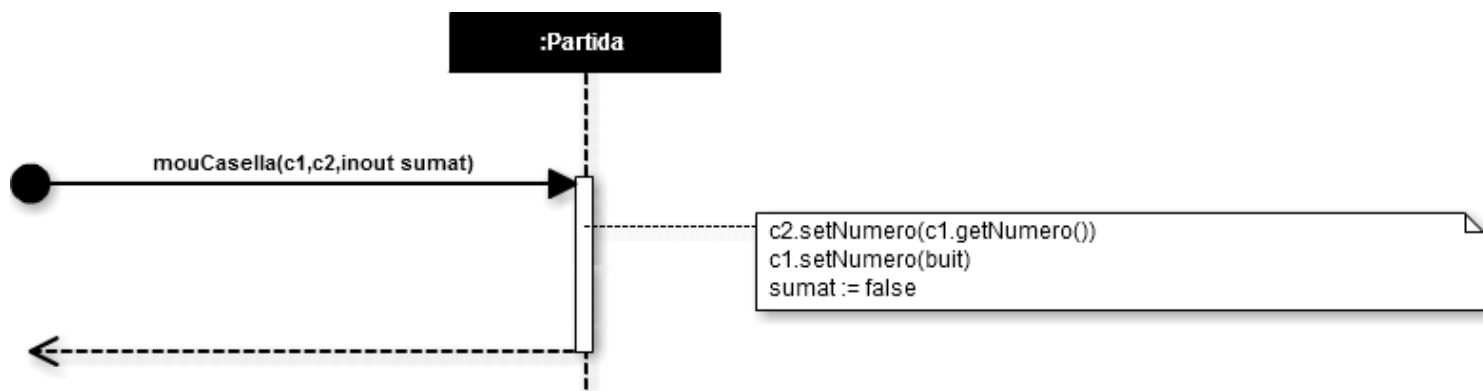

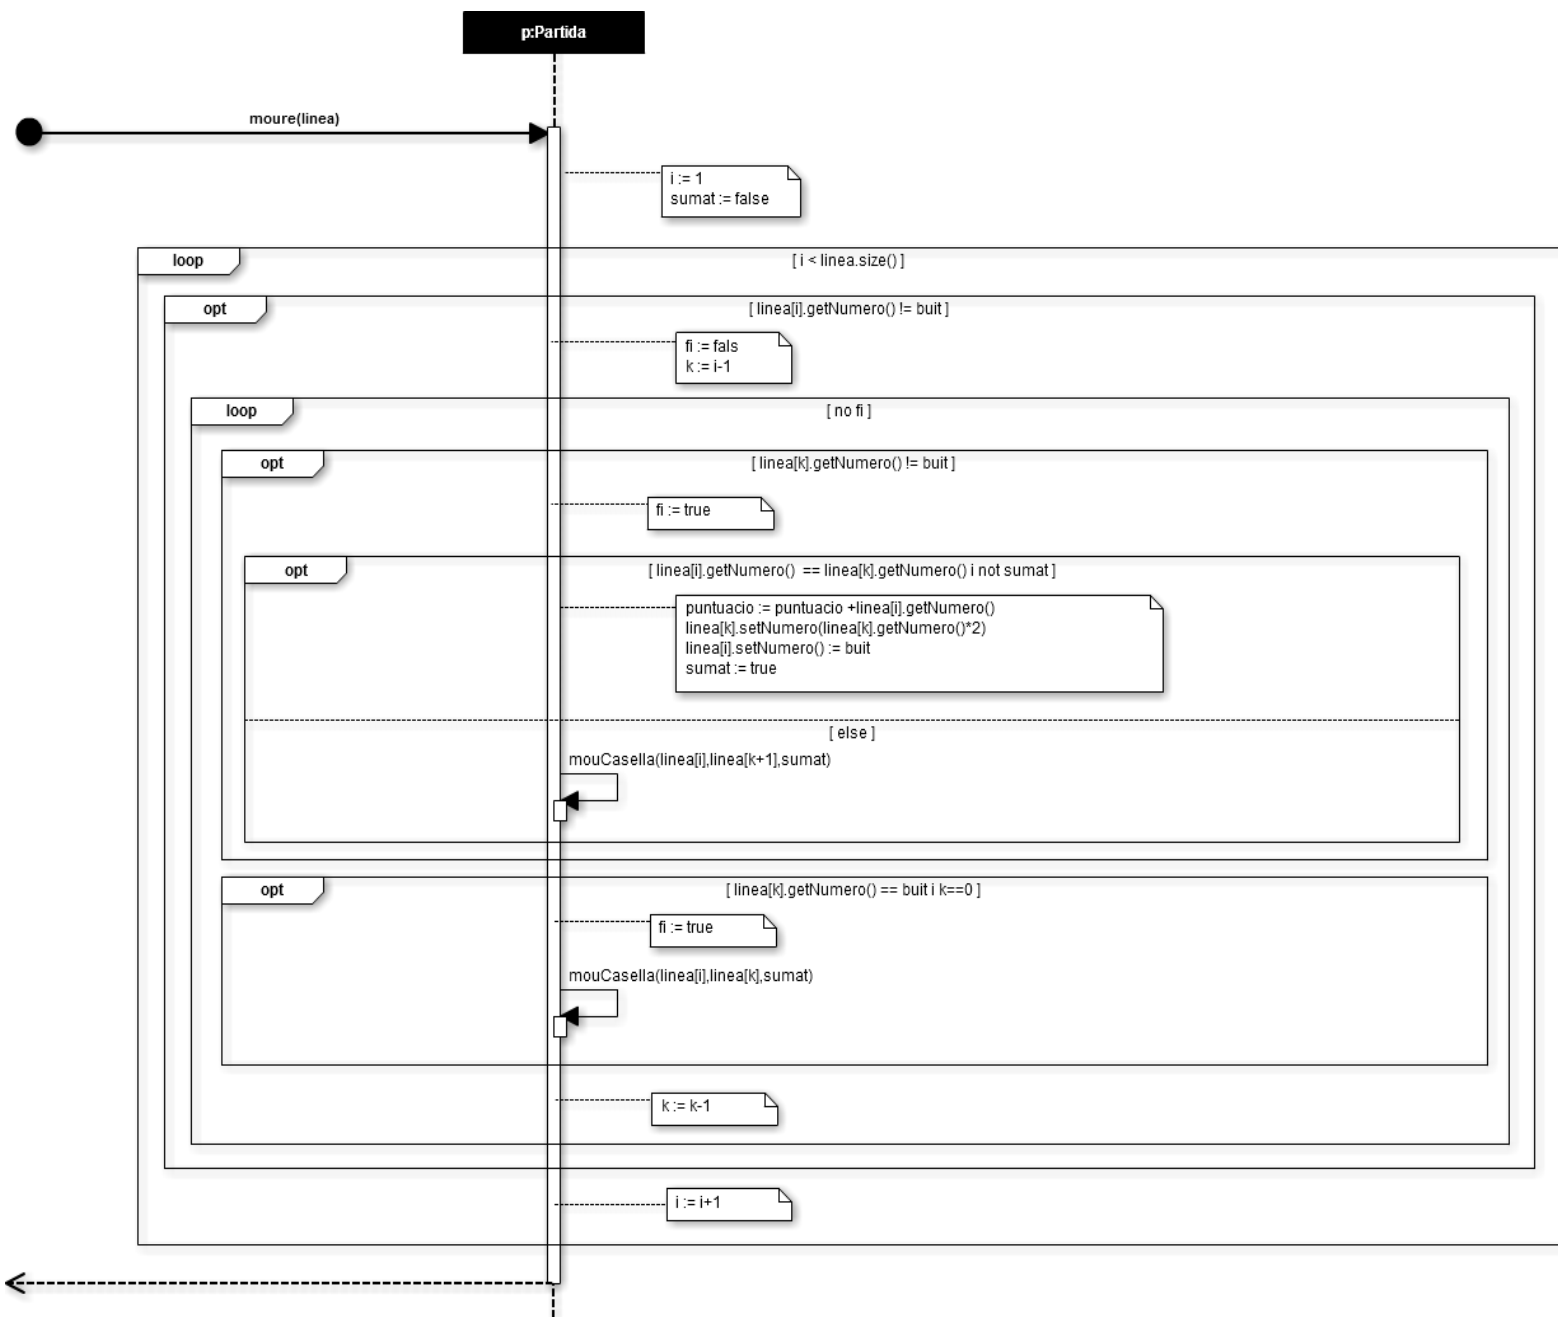

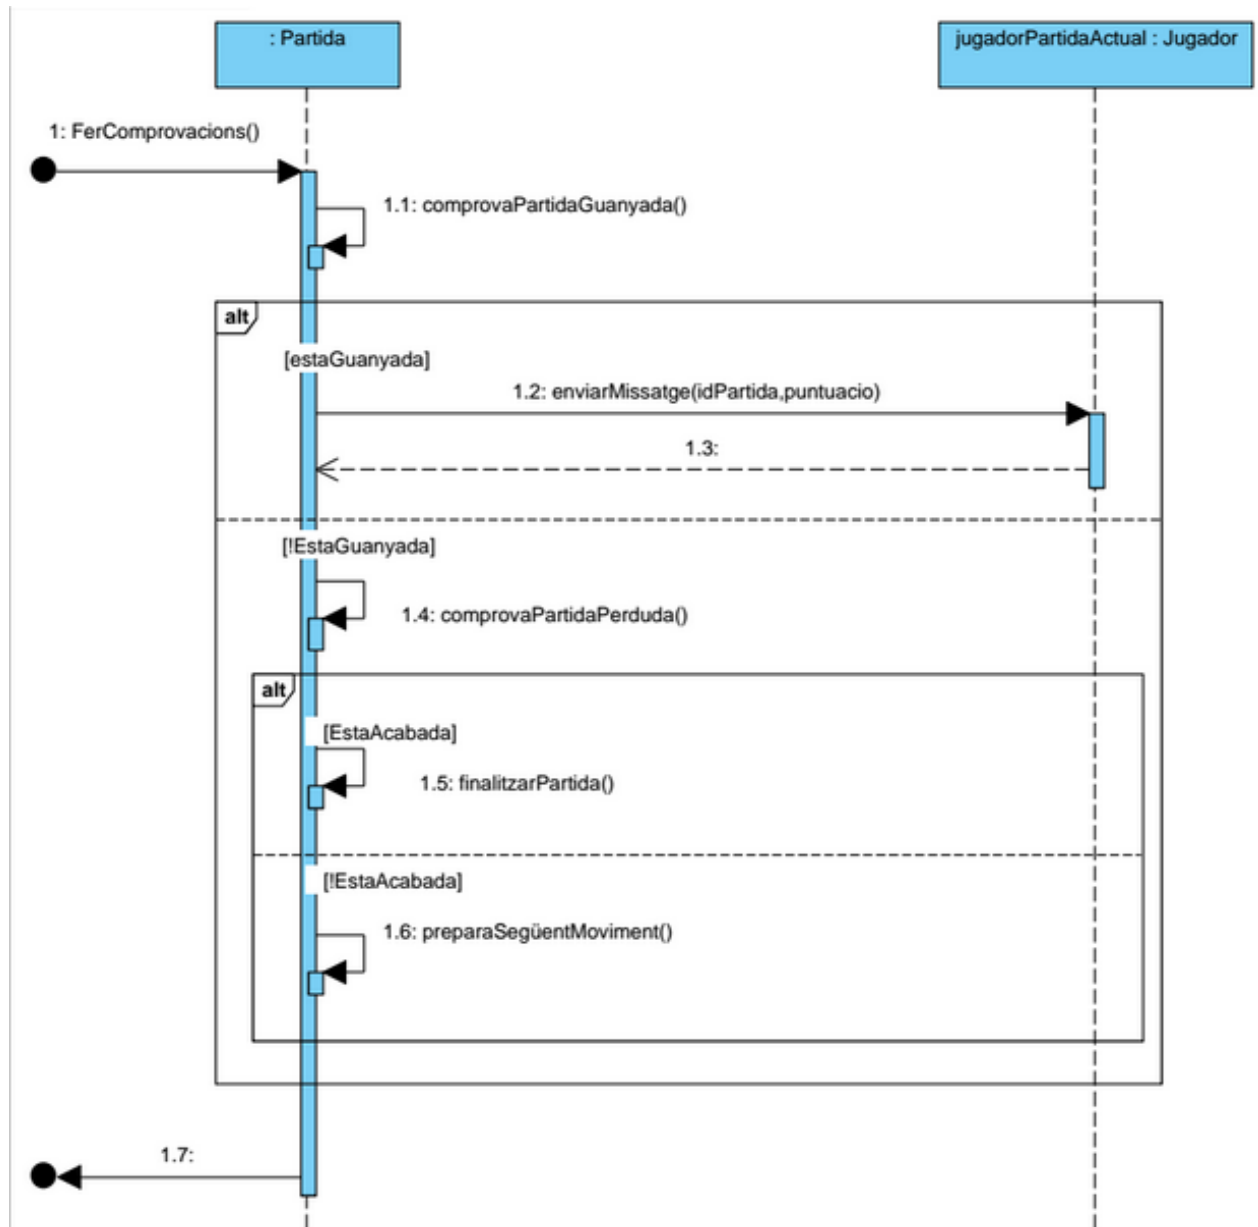

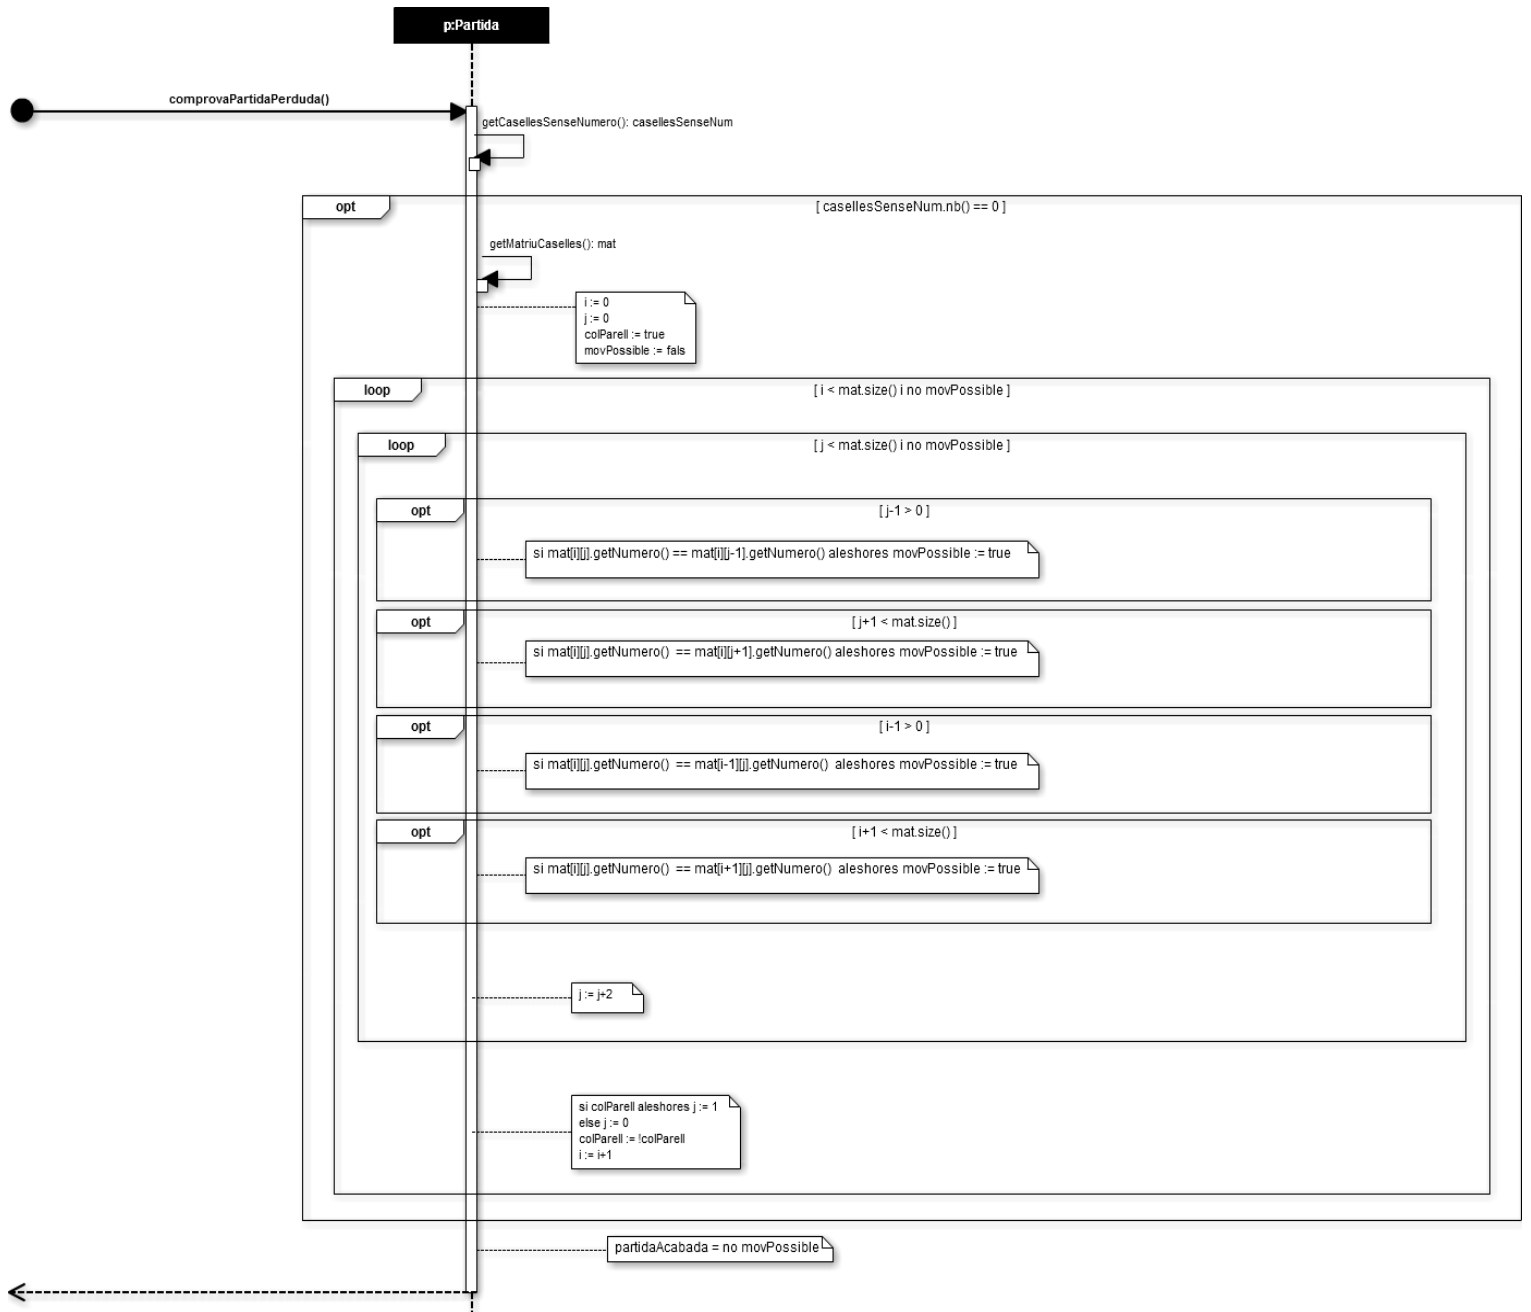

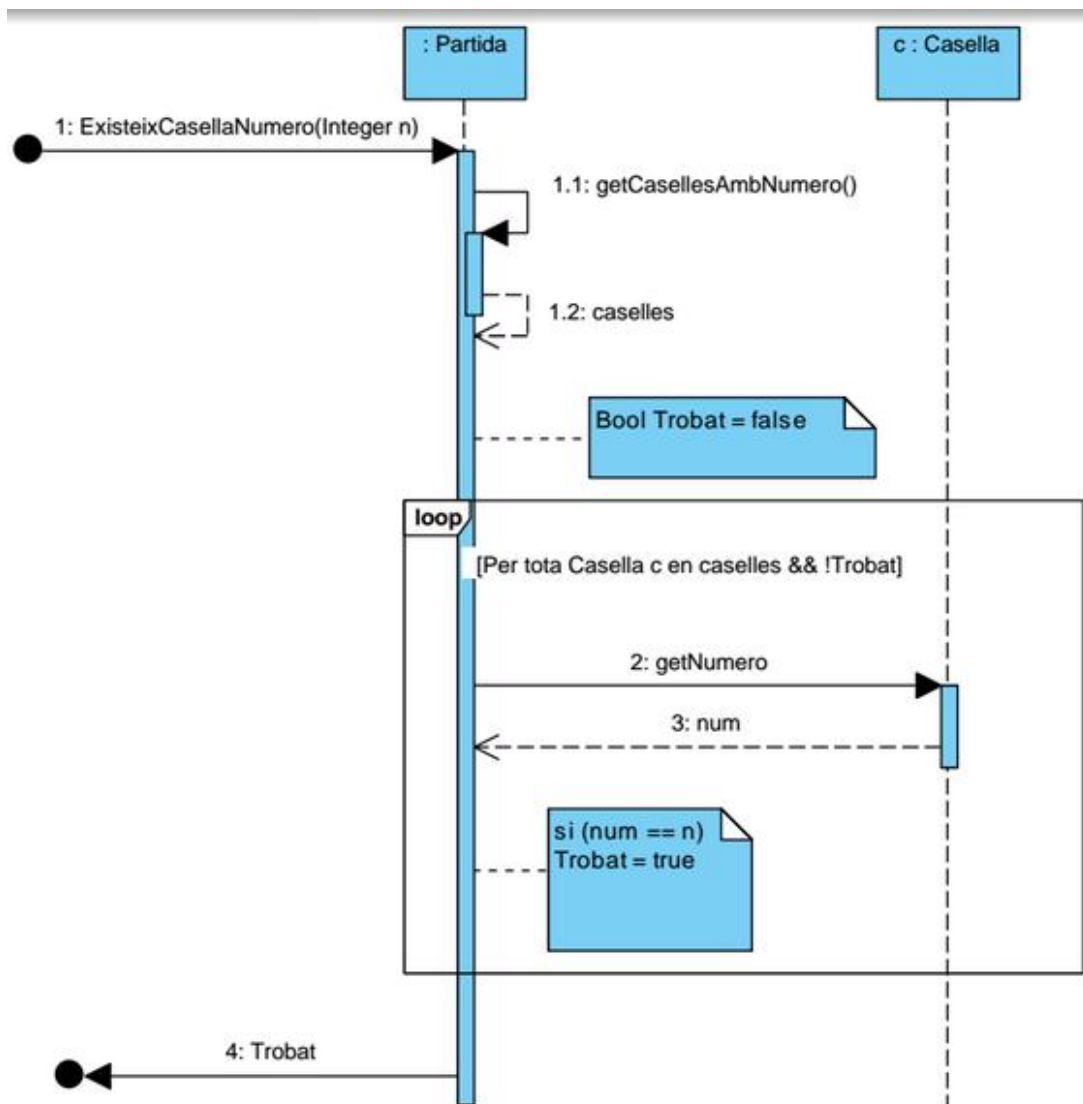

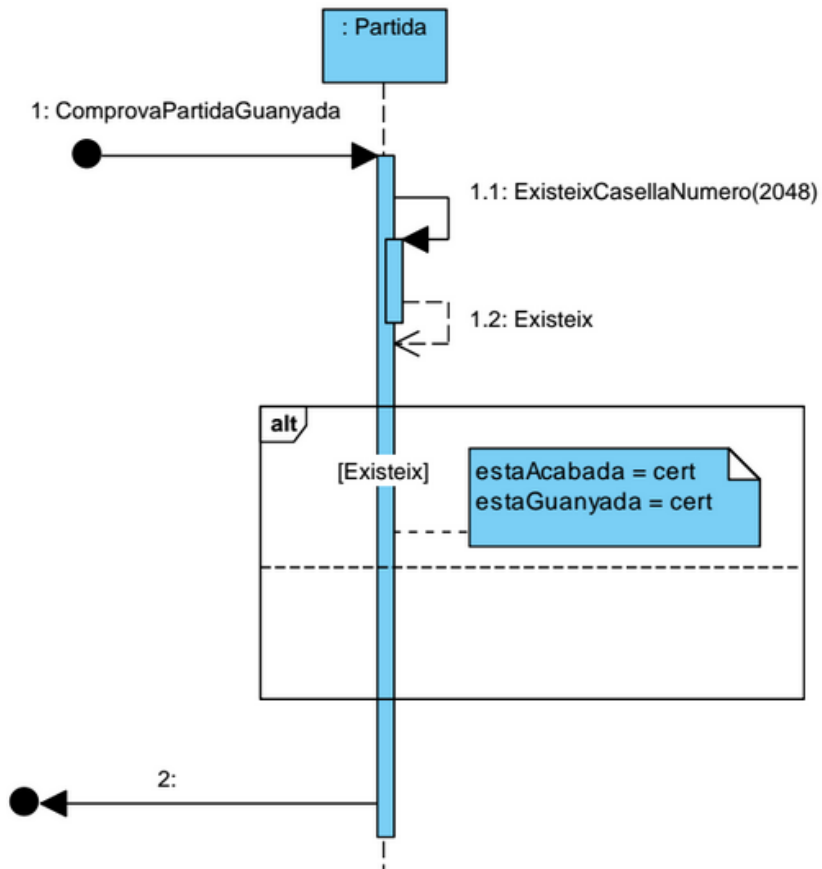

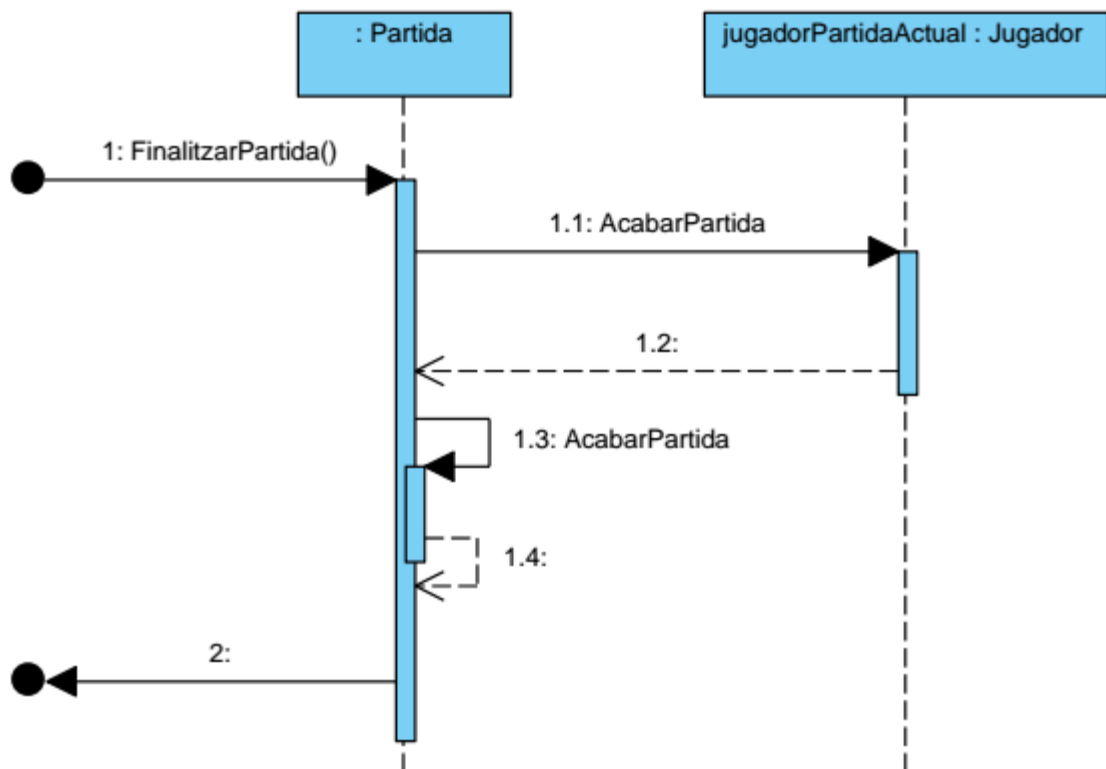

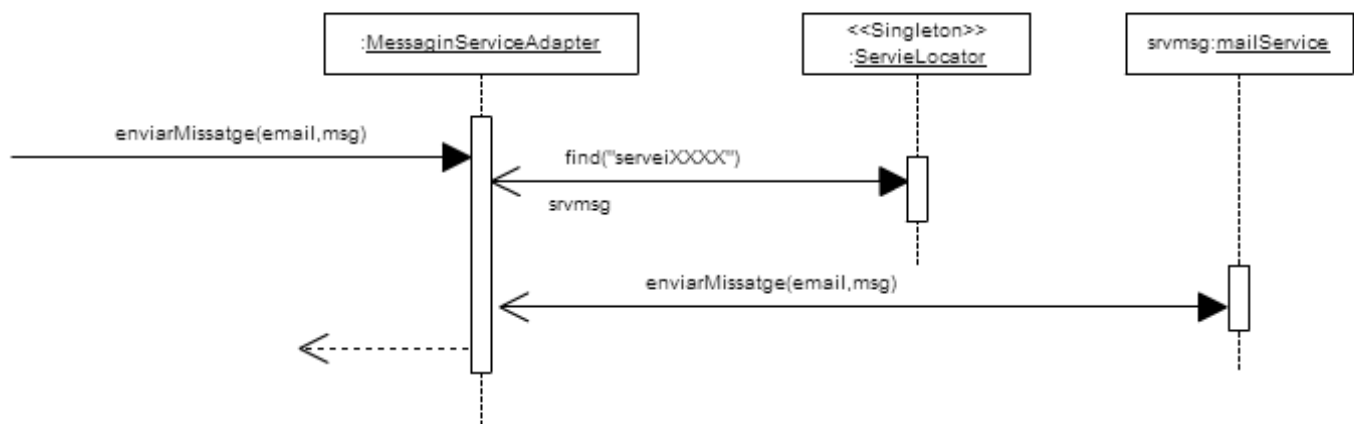

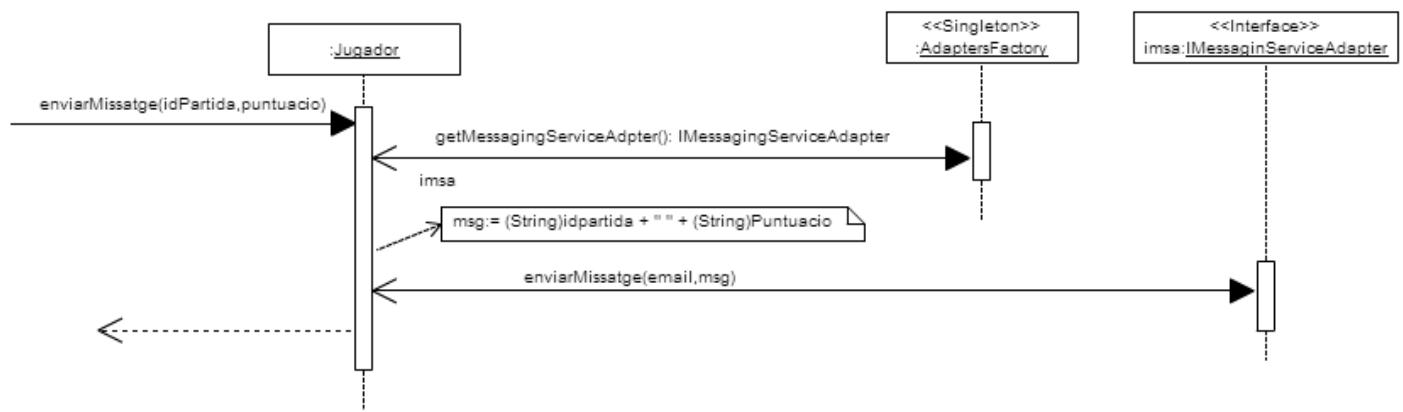

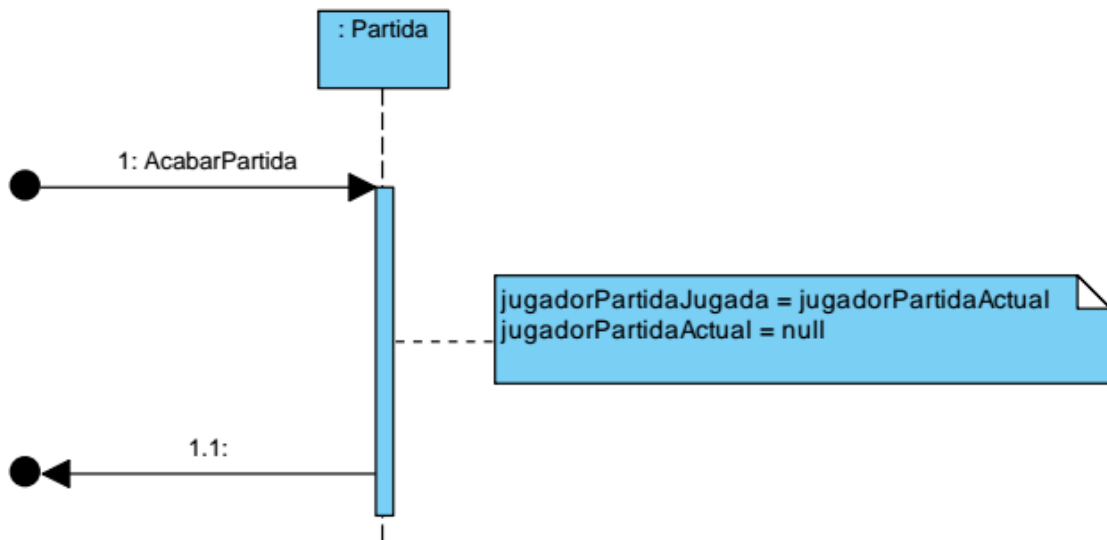

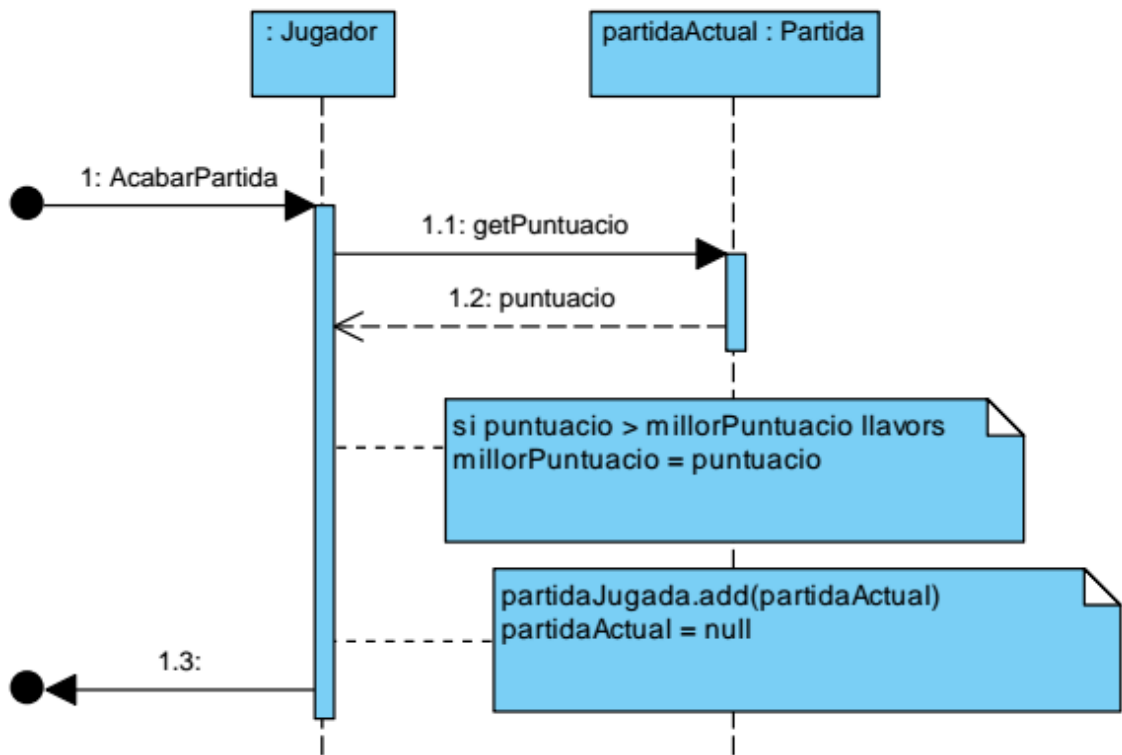

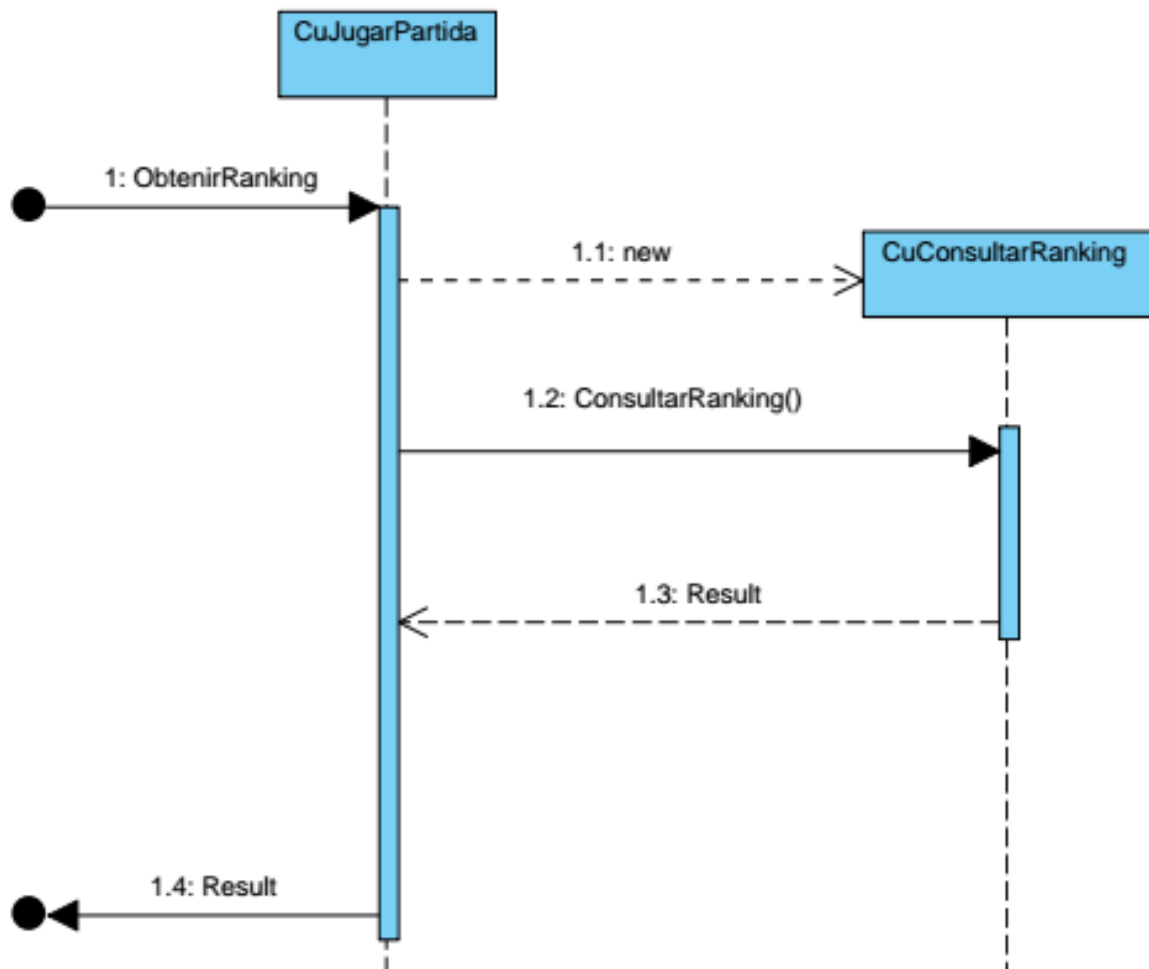

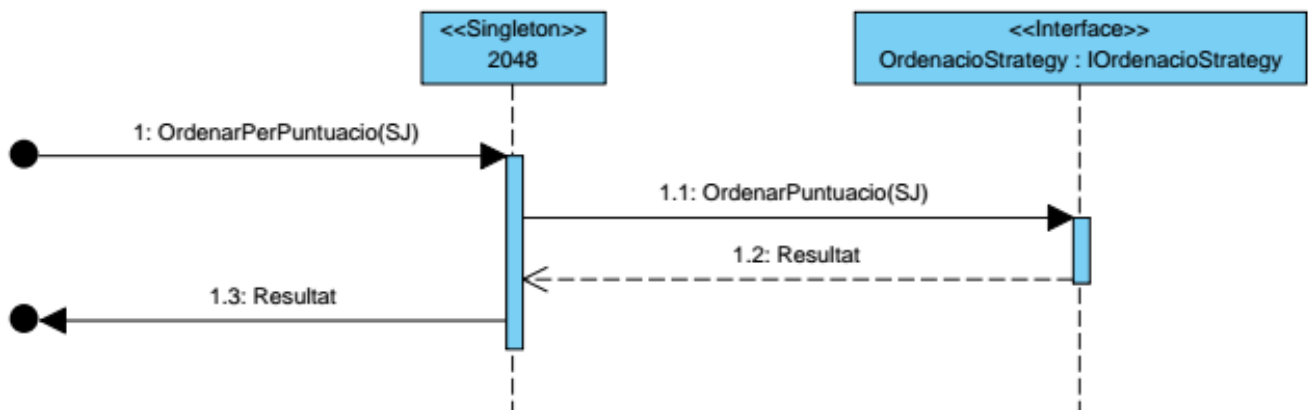

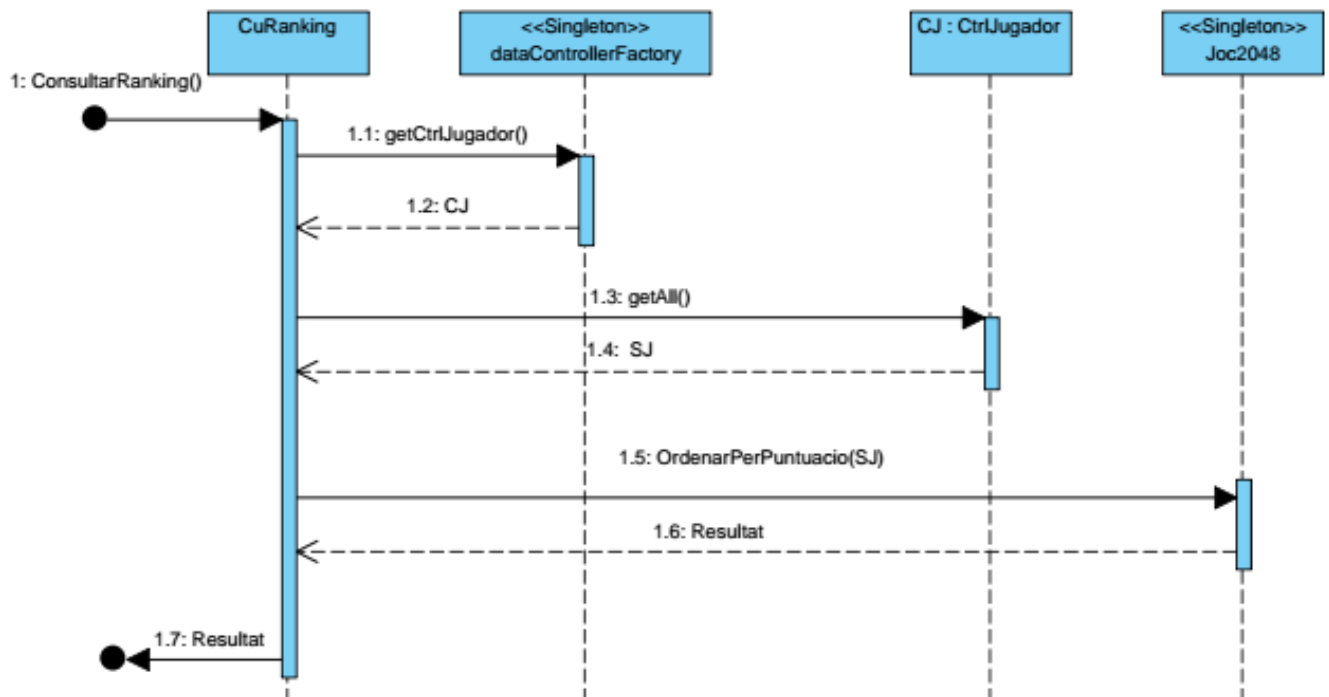

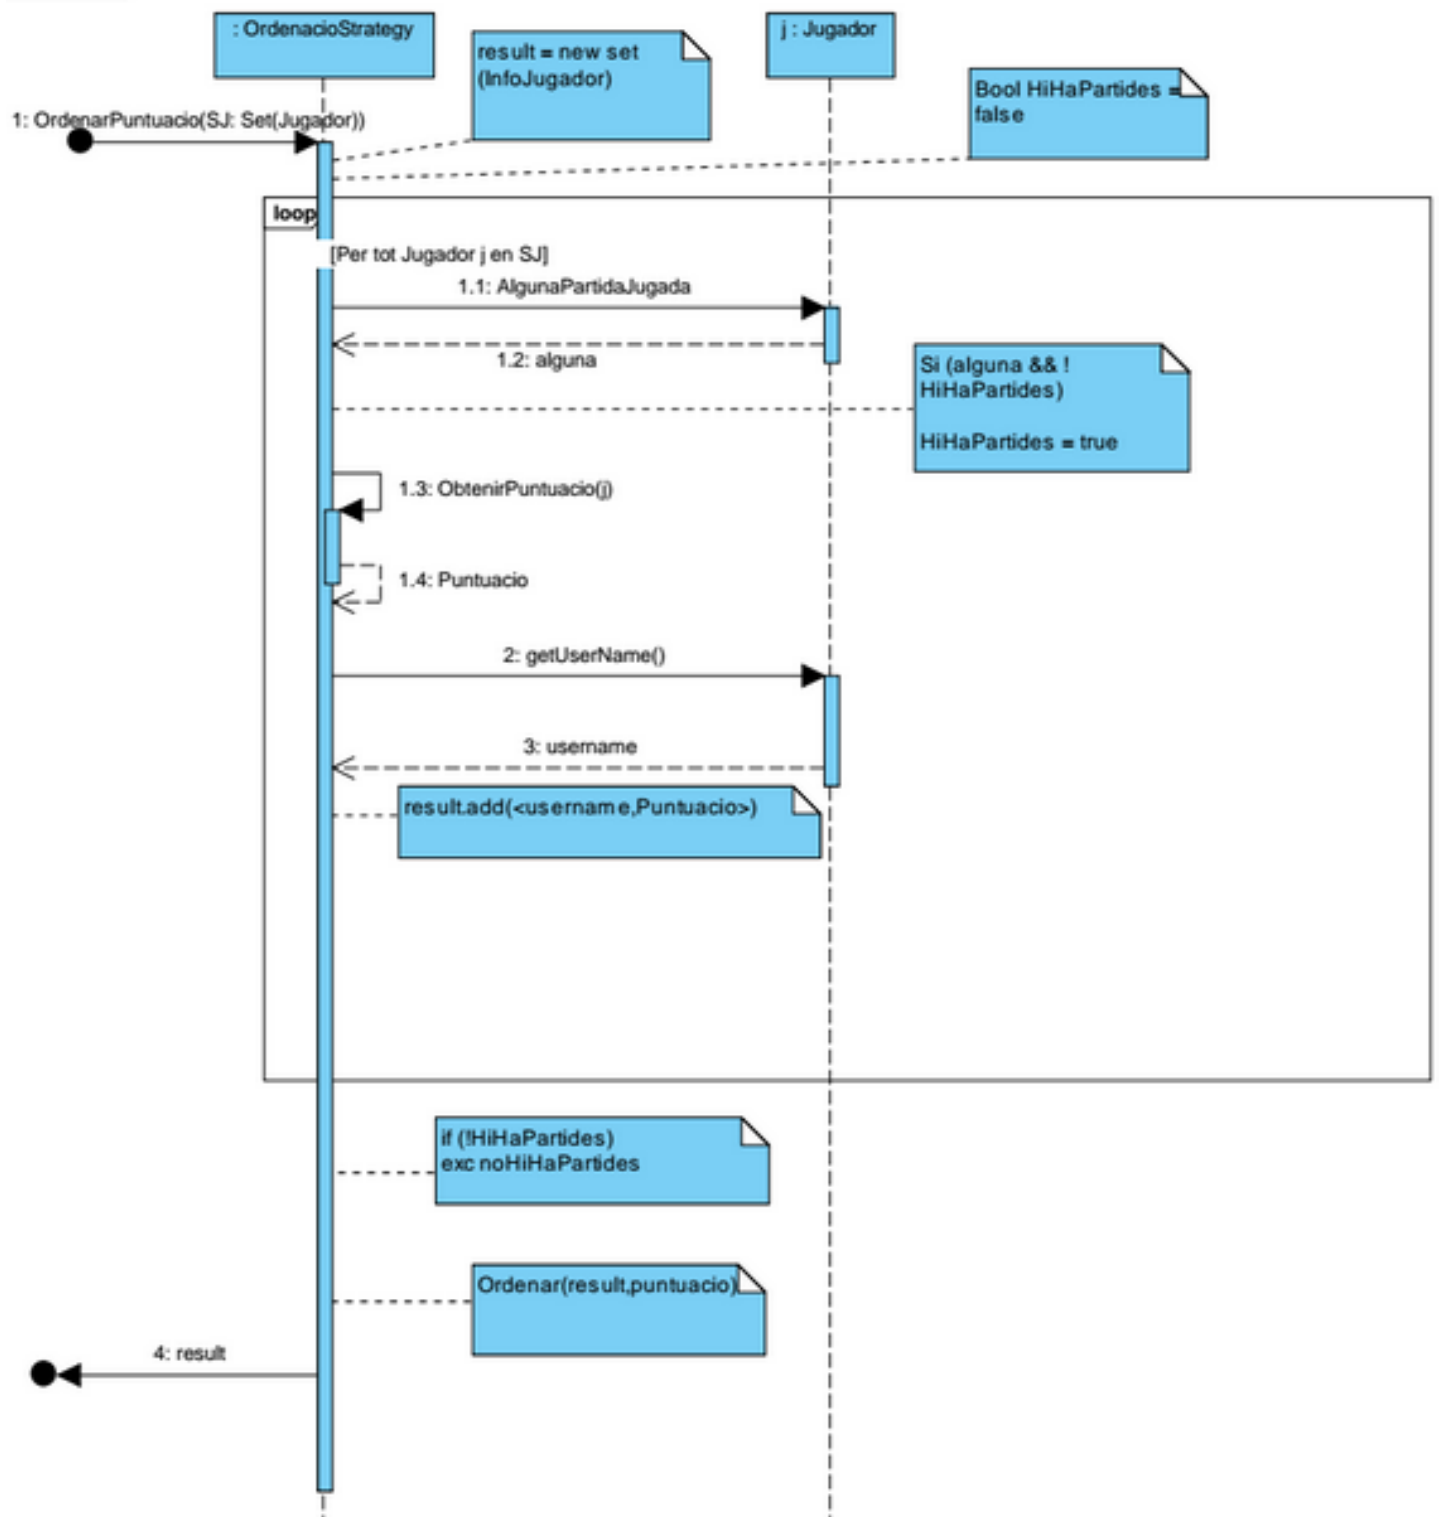

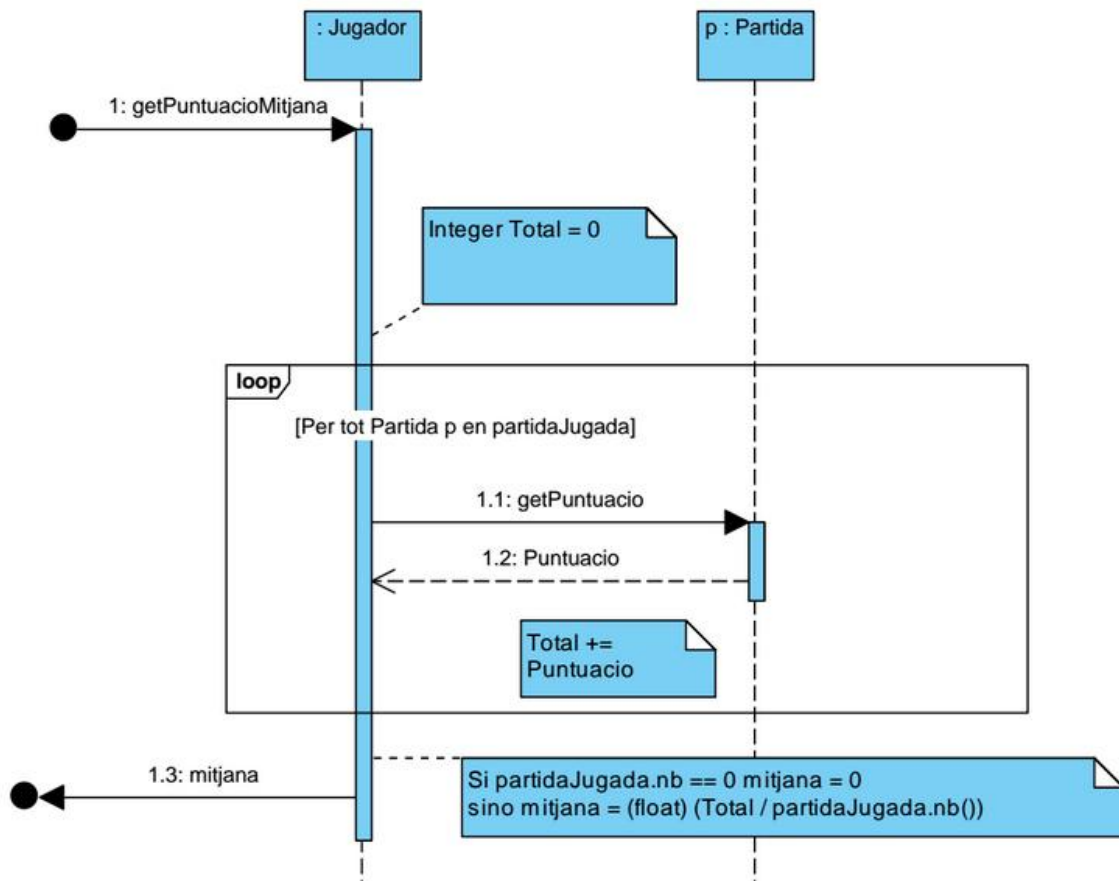

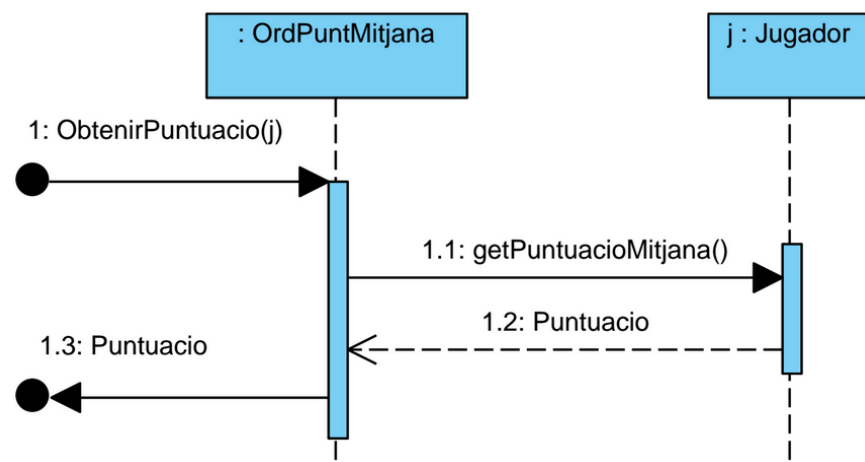

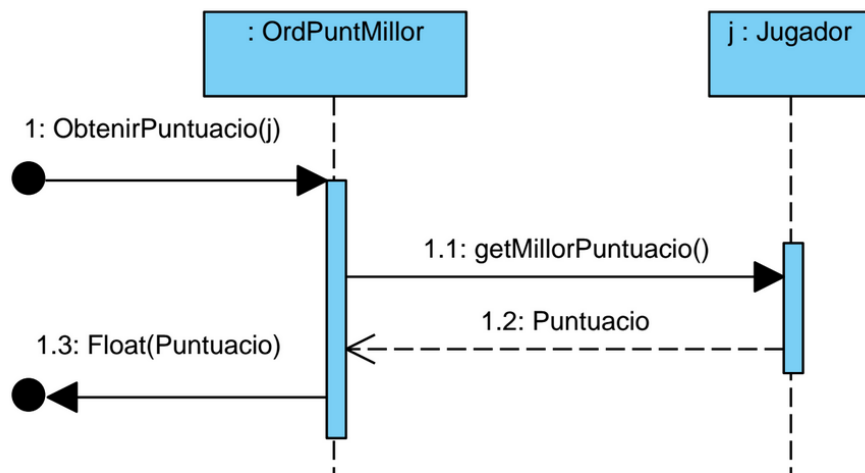

#### iv. Contrato ObtenirRanking

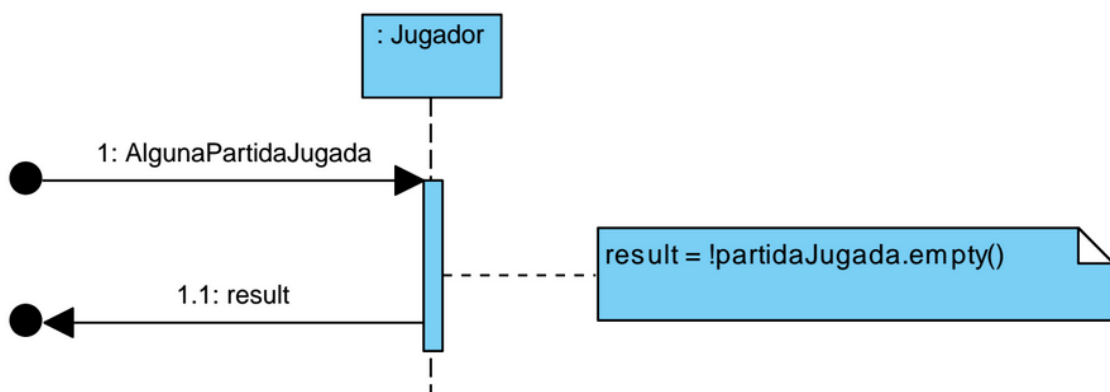

### c. Caso de uso Consultar Ranking

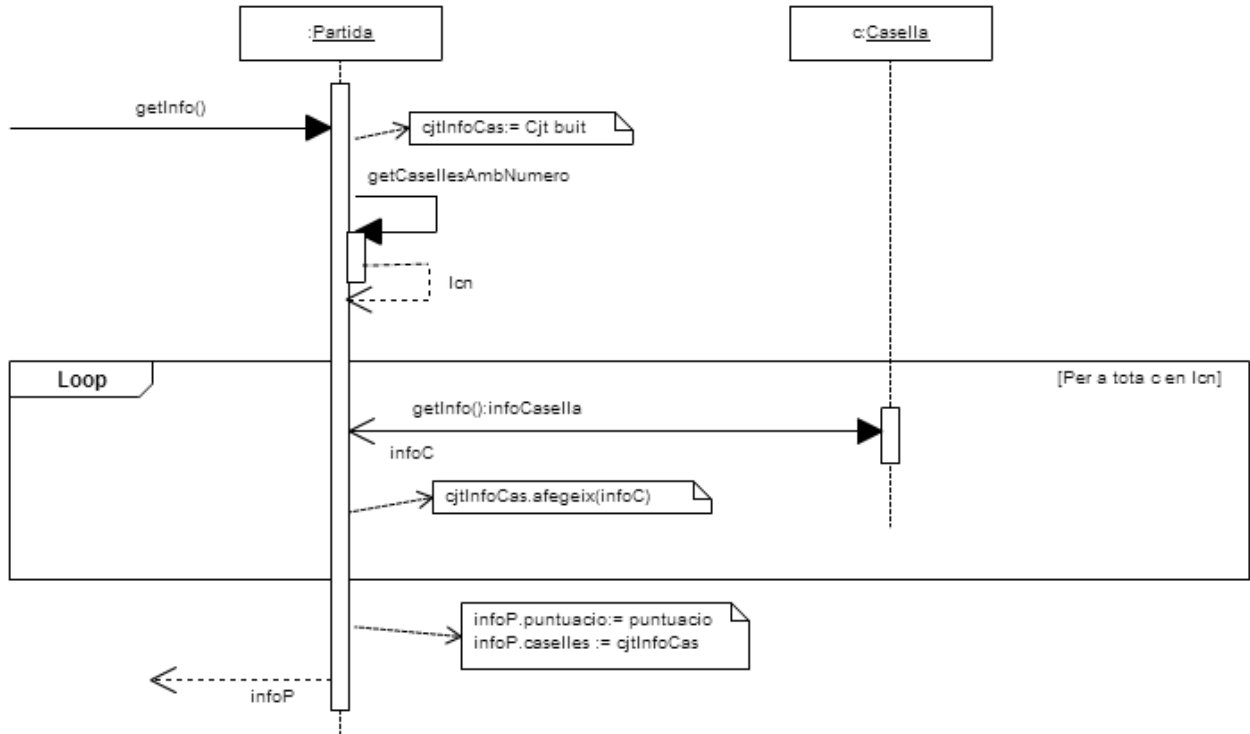

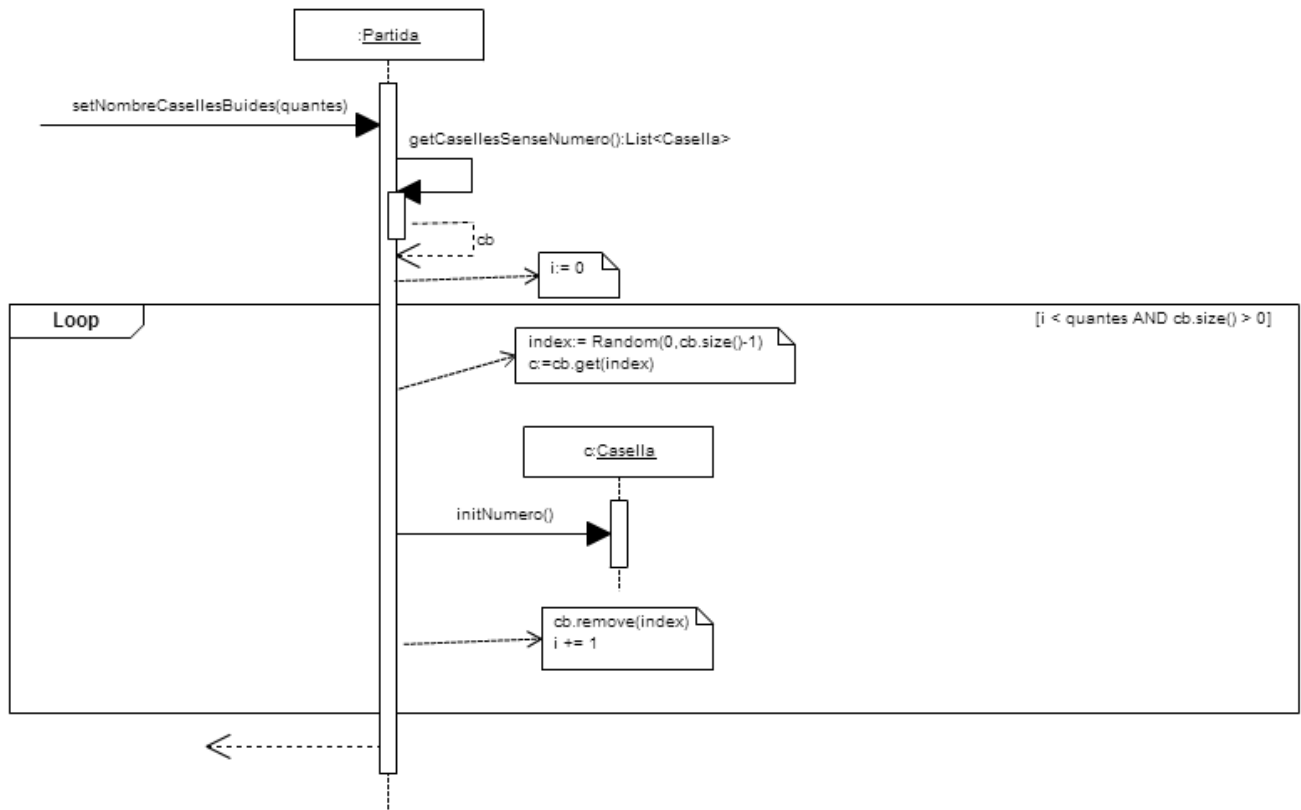

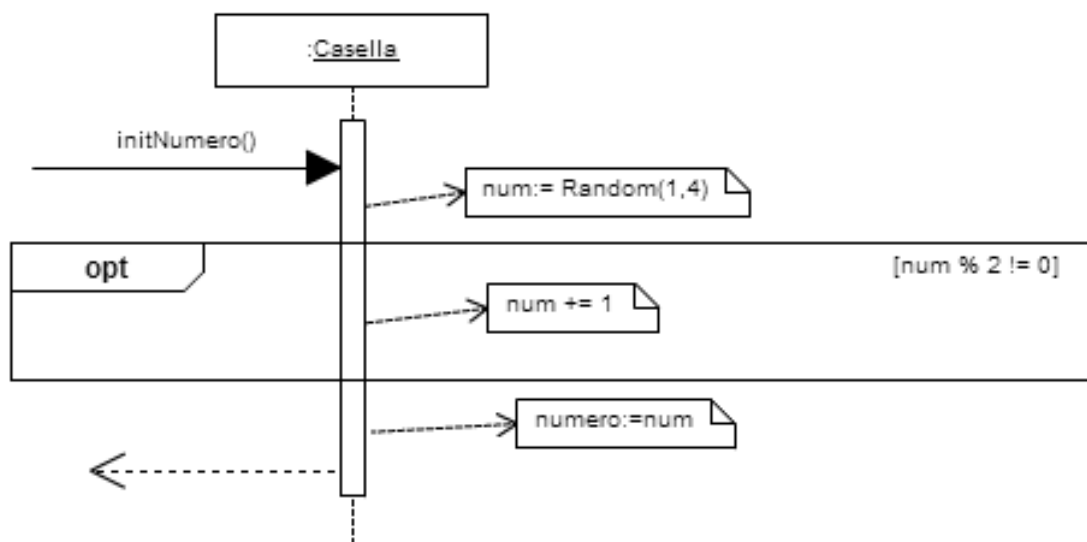

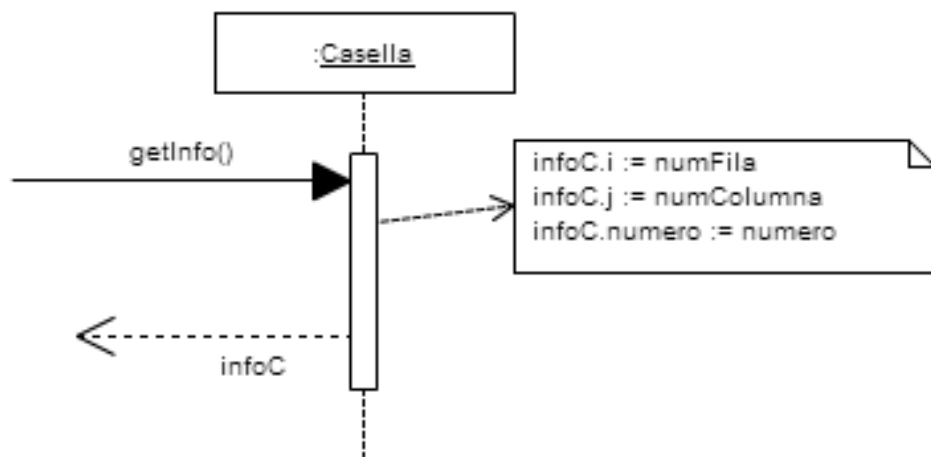

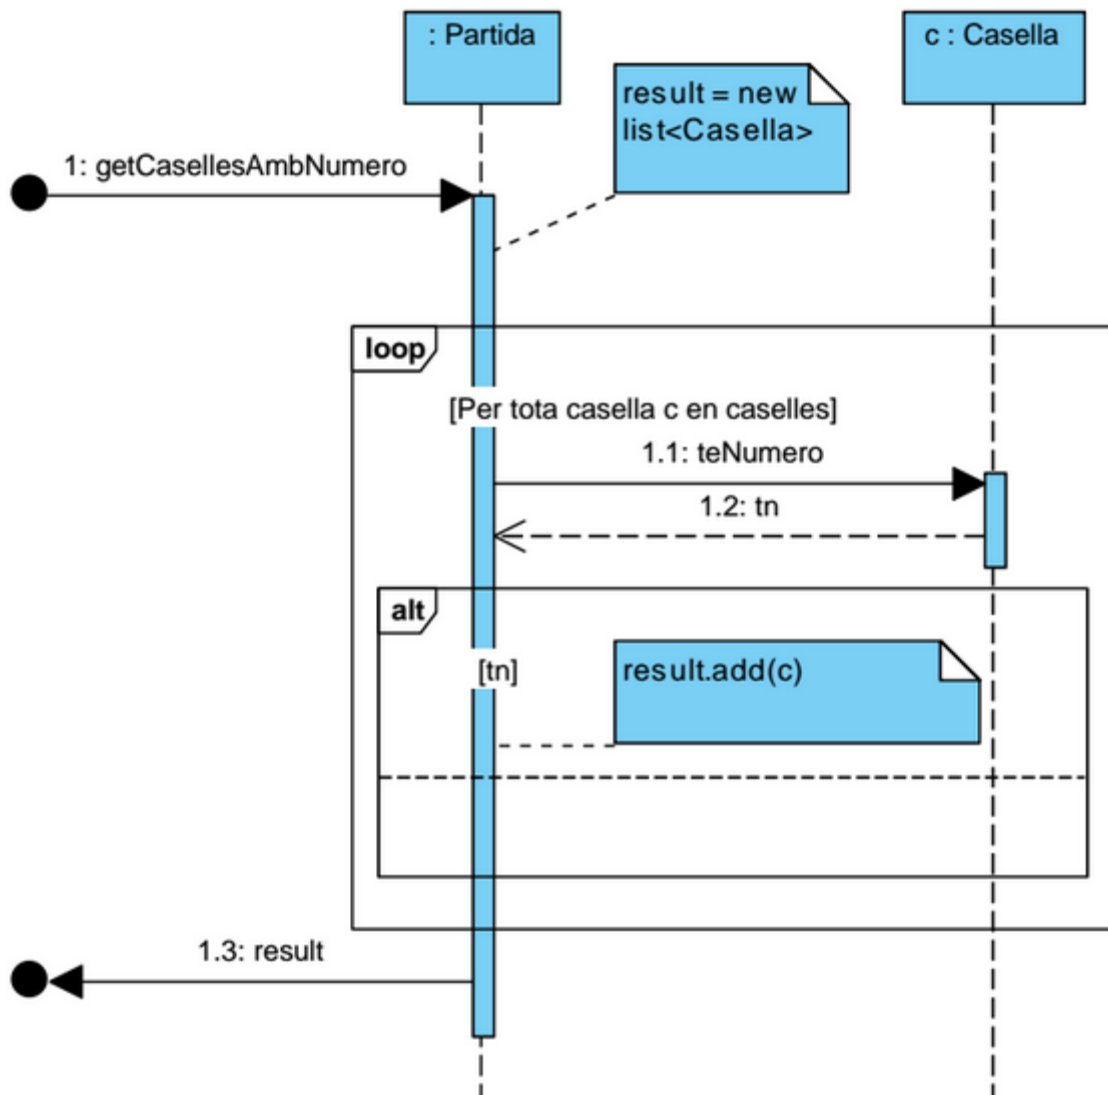

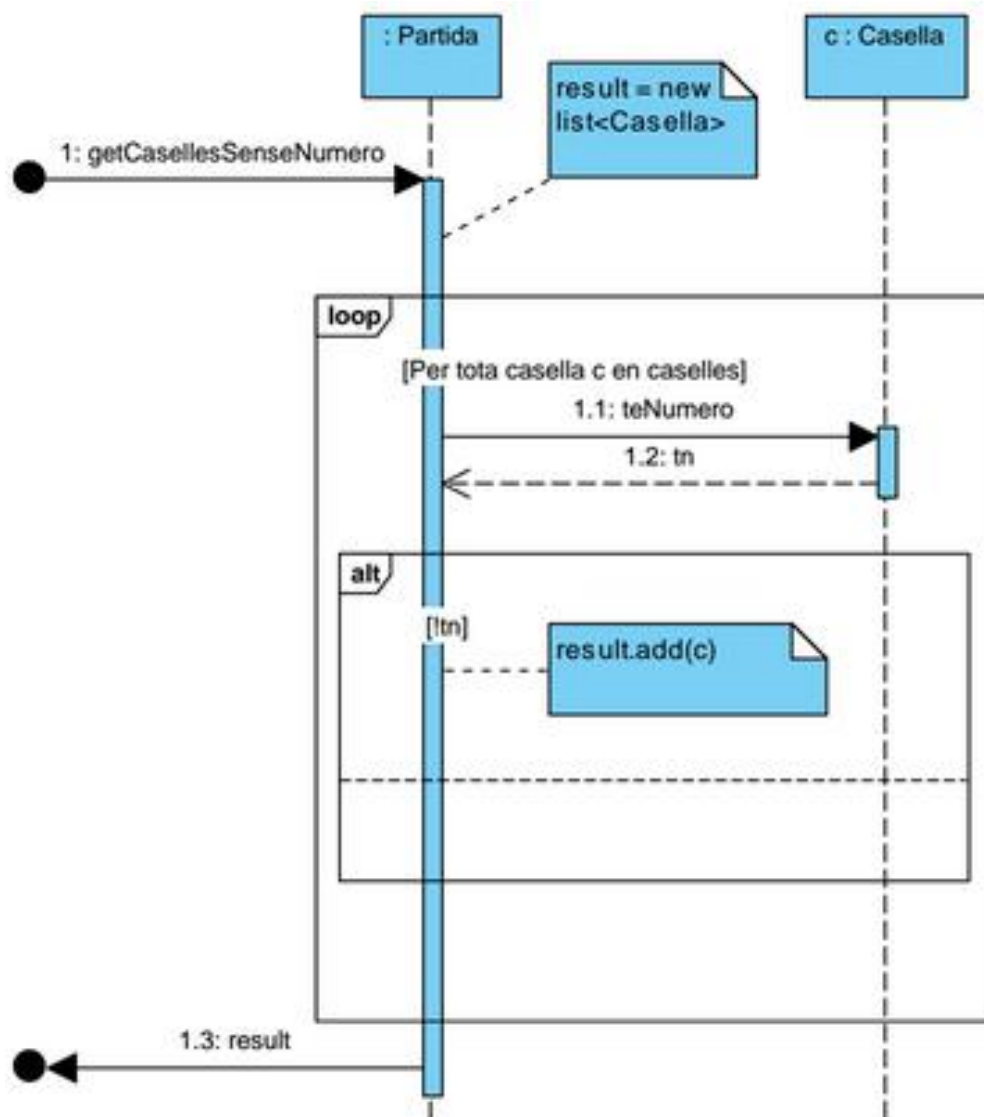

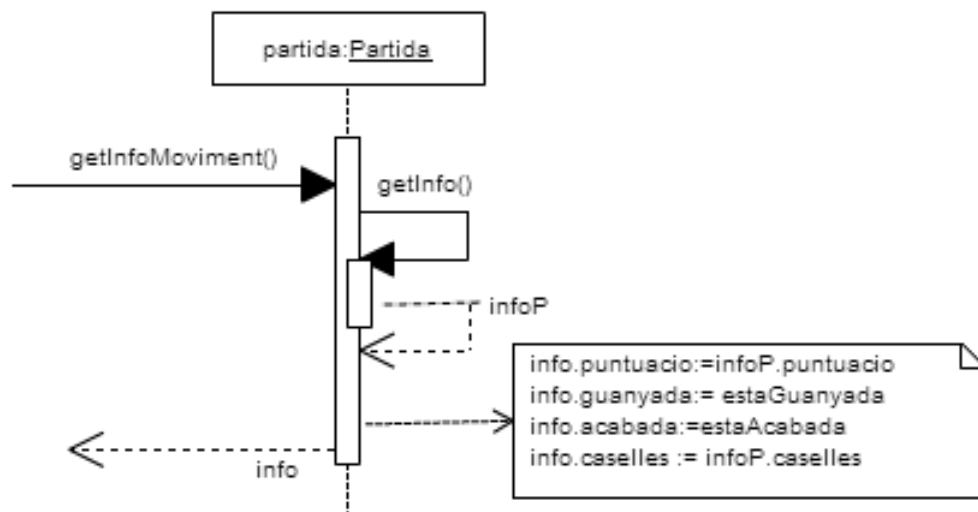

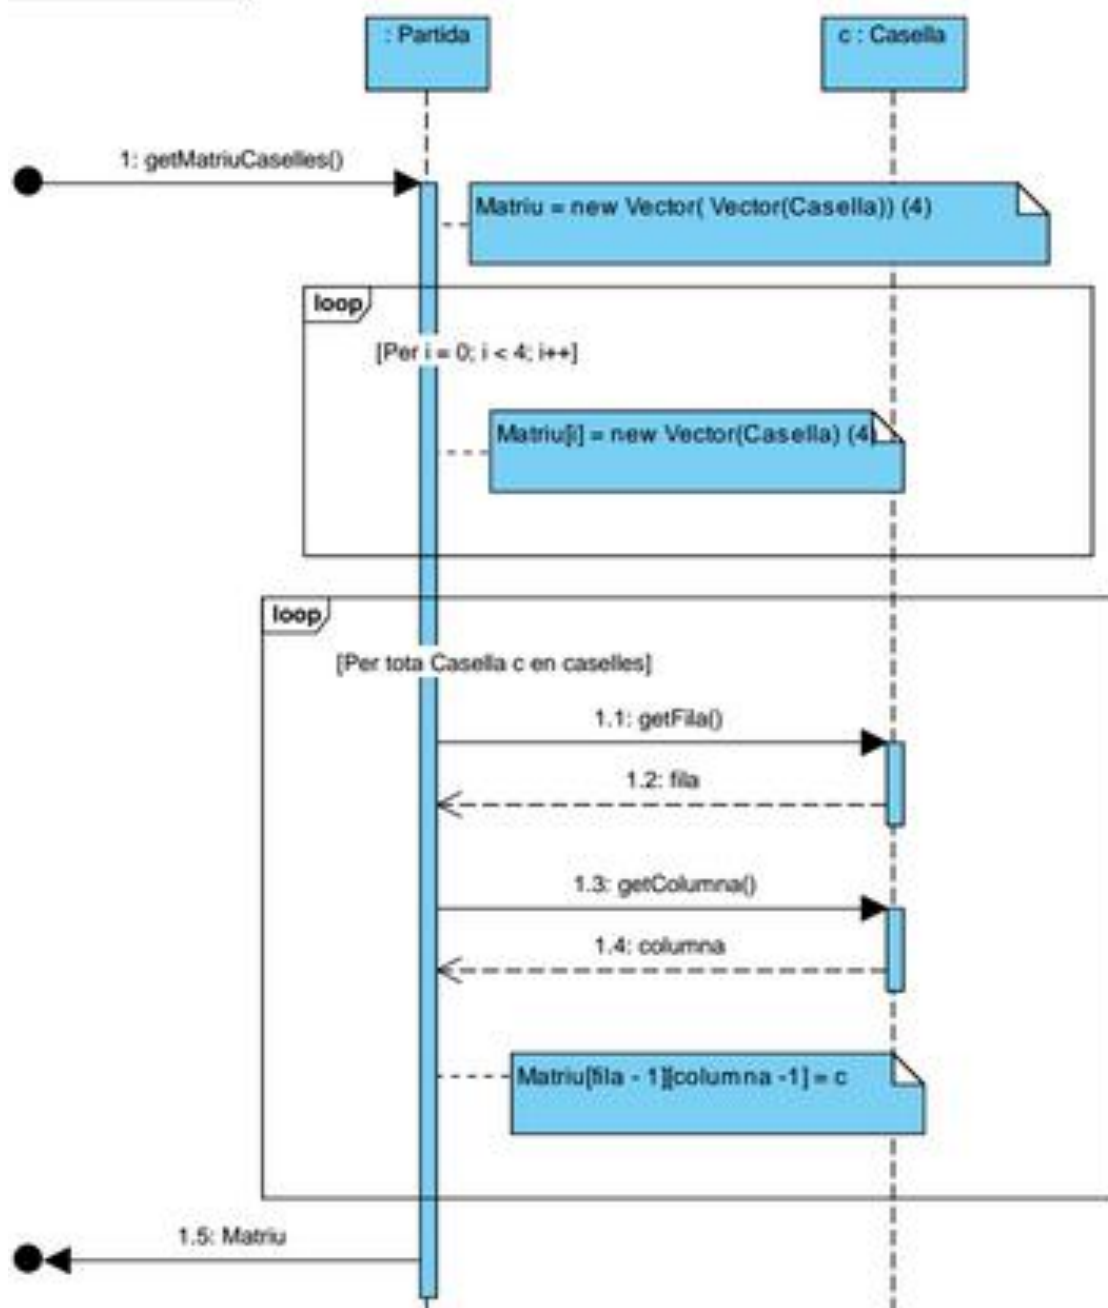

#### d. Utilitats comunes entre contractes i casos d'us

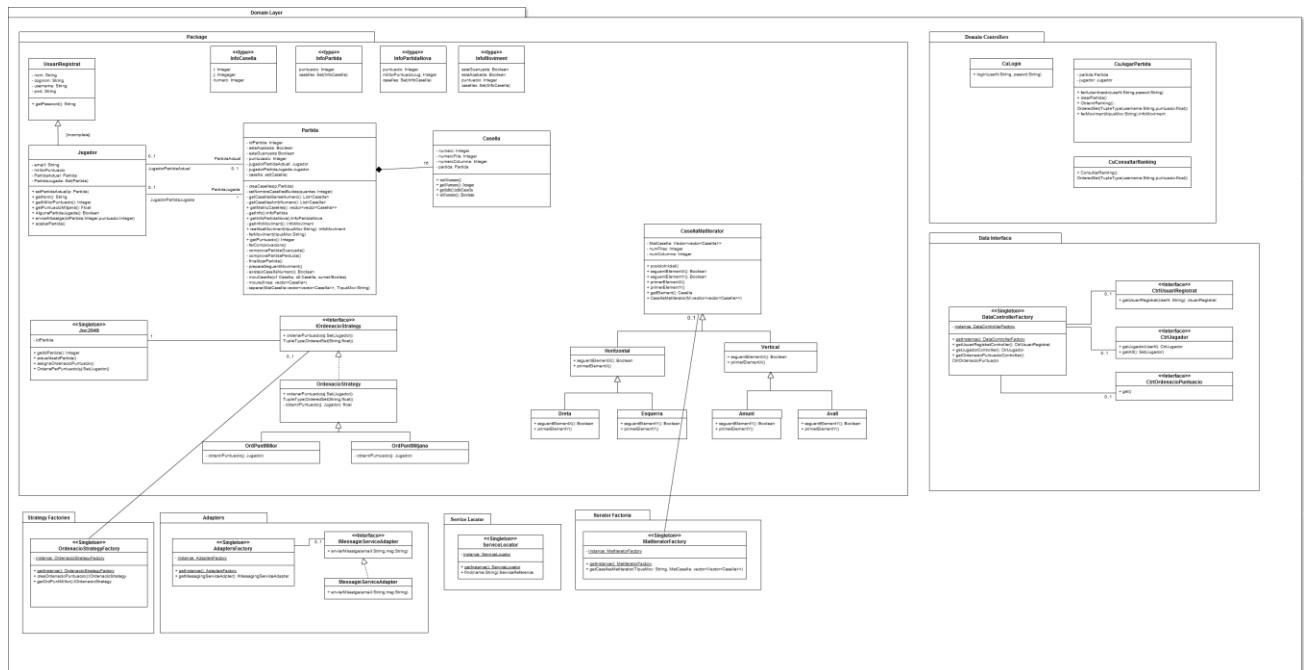

### c. Ejercicio 3

Adjuntem links del diagrama per a visualitzar-lo millor:

<https://cacao.com/diagrams/k3H6arAw0SPfpexo>

<https://cacao.com/diagrams/k3H6arAw0SPfpxzo-78B44.png>

## **d. Ejercicio 4**

### **a. Patró adaptador**

El patró adaptador s'utilitza durant la fase de fer comprovacions del contracte de FerMoviment. La post comprovaPartidaGuanyada ens indica que cal enviar un missatge en el moment en que un jugador guanya la partida. Aquest missatge s'ha d'enviar mitjançant un servei de missatgeria del qual no ens donen més informació que la capçalera de l'operació. Aleshores, per la necessitat de permetre que la nostra interfície i la del servei es comuniquin i per desacoplar aquest servei del nostre sistema, hem usat el patró adaptador: hem definit la interfície IMessageinServiceAdapter implementada per la classe MessageinServiceAdapter, que se n'encarrega de cercar el servei de missatgeria i enviar-li el missatge (cridant a la funció corresponent del servei) que el jugador li proporciona.

### **b. Patró factoria**

El patró factoria s'utilitza a les classes OrdenacioStrategyFactory, AdaptersFactory, MatIteratorFactory i DataControllerFactory. L'aplicació d'aquest patró sorgeix de la necessitat de tenir classes responsables de la creació d'objectes amb una creació lògica complexa (OrdenacioStrategyFactory, MatIteratorFactory) o bé per millorar la cohesió (AdaptersFactory, DataControllerFactory).

### **c. Patró estratègia i patró plantilla**

El patró estratègia s'utilitza durant la fase d'obtenció del rànkig de puntuacions. Sorgit de la necessitat de fer un disseny canviable per a dues polítiques d'ordenació diferents però relacionades creem la interfície IOrdenacióStrategy implementada per OrdenacioStrategy. A aquesta classe, donat que tenim una part de l'estratègia d'ordenació que és comuna independentment de quina estratègia fem servir, apliquem el patró plantilla. Així doncs, definim dues classes filles OrdPuntMillor i OrdPuntMitjana. D'aquesta forma, a OrdenacioStrategy fem la part comuna de les dues estratègies i a les classes filles hi definim la part no comuna.

### **d. Patró singleton**

El patró singleton el fem servir a les classes OrdenacioStrategyFactory, AdaptersFactory, ServiceLocator, MatIteratorFactory i DataControllerFactory. L'aplicació d'aquest patró a la pràctica sorgeix de la necessitat de tenir al sistema certes classes (les mencionades anteriorment) amb una sola instància que sempre ha de ser accessible.

### e. Patró iterador

El patró iterador s'utilitza durant la fase de separació de les caselles del tauler, la classe que el duu a terme és la "iteradorMatriuCaselles" que defineix una forma d'accedir a les caselles del tauler.

Aquesta classe utilitza una combinació del patró estratègia i l'iterador, integrant dins seu un iterador bastant simple sobre una matriu (utilitza 2 variables, que corresponen a la fila i la columna de la matriu en referència)

La necessitat d'utilitzar-lo sorgeix de l'abstracció de que qualsevol moviment (amunt,avall,dreta,esquerra) realitza el mateix si "girem" el tauler. La seqüència del moviment es podria definir com a única d'aquesta manera:

- 1: Girar el tauler segons el moviment tal que el moviment s'orienti sempre cap a un únic sentit
- 2: Separar el tauler en 4 grups, els quals seràn format pel conjunt de caselles que es desplaçaràn de forma conjunta en el moviment
- 3: Moure cada grup de caselles

Aquesta classe s'encarrega del cas 1, utilitzant la estratègia i l'iterador, però en comptes de girar el tauler en sí mateix, interpreta els índex de la matriu com a punts en el pla i després canvia els eixos de coordenades aconseguint, d'aquesta forma, un efecte similar a la rotació.

La part d'aquesta classe que s'encarrega de realitzar el patró estratègia realitza el següent:

Diguem que 4 sub classes implementen la estratègia sobre com separar una matriu de caselles. Donat que existeixen 4 moviments, cada estratègia interpreta en el seu interior els eixos direccionals de la matriu per tal de dur a terme aquesta tasca.

**Nota:** no és una aplicació estricta del patró estratègia en el sentit de que no implementa una interfície, tot i així el comportament és similar.

La part que realitza l'iterador, s'encarrega d'enmagatzemar la posició actual de la matriu dins de cada objecte, i permet modificar els dos apuntadors en qualsevol moment dins de la pròpia classe, a més d'oferir una operació per accedir a l'element de la matriu actual. La forma de moure l'iterador sobre la matriu la duen a terme les 4 sub-classes, cadascuna de la seva forma.

L'eix de les abscises (x) serà l'eix que contindrà els 4 grups de caselles (independents entre ells pel moviment). L'eix de les ordenades (y) contindrà l'apuntador a la casella dins de cada grup.

Així doncs, per tal de separar la matriu caldrà primer recorre tots els elements de l'eix x; i per cada un d'ells agafar les 4 caselles dels punts (x,0) ... (x,3) Aquesta feina la realitza el pas 2, i és inherent d'aquesta classe

En definitiva, el que aquesta classe permet és dividir convenientment la matriu segons el tipus de moviment desitjat.

Exemple:

Partim d'aquest tauler i del moviment cap amunt:

		2	4
	4	4	
8			8
	4	2	

La classe amunt interpretarà la matriu com:

eix X				eix Y
		2	4	
	4	4		
8			8	
	4	2
